CHAPTER

ONE

INTRODUCTION

Python client implementation for qBittorrent Web API.

Currently supports qBittorrent v5.1.2 (Web API v2.11.4) released on Jul 2, 2025.

1.1 Features

- The entire qBittorrent Web API is implemented.
- qBittorrent version checking for an endpoint's existence/features is automatically handled.
- If the authentication cookie expires, a new one is automatically requested in line with any API call.

1.2 Installation

• Install via pip from PyPI:

```
python -m pip install qbittorrent-api
```

• Install a specific release (e.g. v2024.3.60):

```
python -m pip install qbittorrent-api==2024.3.60
```

• Install direct from main:

pip install git+https://github.com/rmartin16/qbittorrent-api.git@main#egg=qbittorrent-api

- Enable WebUI in qBittorrent: Tools -> Preferences -> Web UI
- If the Web API will be exposed to the Internet, follow the recommendations.

1.3 Getting Started

```
import qbittorrentapi

# instantiate a Client using the appropriate WebUI configuration
conn_info = dict(
   host="localhost",
   port=8080,
```

(continues on next page)

(continued from previous page)

```
username="admin",
   password="adminadmin",
qbt_client = qbittorrentapi.Client(**conn_info)
# the Client will automatically acquire/maintain a logged-in state
# in line with any request. therefore, this is not strictly necessary;
# however, you may want to test the provided login credentials.
    qbt_client.auth_log_in()
except qbittorrentapi.LoginFailed as e:
   print(e)
# if the Client will not be long-lived or many Clients may be created
# in a relatively short amount of time, be sure to log out:
qbt_client.auth_log_out()
# or use a context manager:
with qbittorrentapi.Client(**conn_info) as qbt_client:
   if qbt_client.torrents_add(urls="...") != "0k.":
        raise Exception("Failed to add torrent.")
# display qBittorrent info
print(f"qBittorrent: {qbt_client.app.version}")
print(f"qBittorrent Web API: {qbt_client.app.web_api_version}")
for k, v in qbt_client.app.build_info.items():
   print(f"{k}: {v}")
# retrieve and show all torrents
for torrent in qbt_client.torrents_info():
   print(f"{torrent.hash[-6:]}: {torrent.name} ({torrent.state})")
# stop all torrents
qbt_client.torrents.stop.all()
```

1.4 Usage

First, the Web API endpoints are organized in to eight namespaces.

- Authentication (auth)
- Application (app)
- Log (log)
- Sync (sync)
- Transfer (transfer)
- Torrent Management (torrents)
- RSS (rss)
- Search (search)

Second, this client has two modes of interaction with the qBittorrent Web API.

Each Web API endpoint is implemented one-to-one as a method of the instantiated client.

However, a more robust interface to the endpoints is available via each namespace. This is intended to provide a more seamless and intuitive interface to the Web API.

Finally, some of the objects returned by the client support methods of their own. This is most pronounced for torrents themselves.

1.4.1 Introduction

Python client implementation for qBittorrent Web API.

Currently supports qBittorrent v5.1.2 (Web API v2.11.4) released on Jul 2, 2025.

Features

- The entire qBittorrent Web API is implemented.
- · qBittorrent version checking for an endpoint's existence/features is automatically handled.
- If the authentication cookie expires, a new one is automatically requested in line with any API call.

Installation

• Install via pip from PyPI:

```
python -m pip install qbittorrent-api
```

• Install a specific release (e.g. v2024.3.60):

```
python -m pip install qbittorrent-api==2024.3.60
```

• Install direct from main:

```
pip install git+https://github.com/rmartin16/qbittorrent-api.git@main#egg=qbittorrent-api
```

- Enable WebUI in qBittorrent: Tools -> Preferences -> Web UI
- If the Web API will be exposed to the Internet, follow the recommendations.

Getting Started

```
import qbittorrentapi
# instantiate a Client using the appropriate WebUI configuration
conn_info = dict(
   host="localhost",
   port=8080,
   username="admin",
   password="adminadmin",
qbt_client = qbittorrentapi.Client(**conn_info)
# the Client will automatically acquire/maintain a logged-in state
# in line with any request. therefore, this is not strictly necessary;
# however, you may want to test the provided login credentials.
try:
   qbt_client.auth_log_in()
except qbittorrentapi.LoginFailed as e:
   print(e)
# if the Client will not be long-lived or many Clients may be created
# in a relatively short amount of time, be sure to log out:
qbt_client.auth_log_out()
# or use a context manager:
with qbittorrentapi.Client(**conn_info) as qbt_client:
    if qbt_client.torrents_add(urls="...") != "0k.":
        raise Exception("Failed to add torrent.")
# display qBittorrent info
print(f"qBittorrent: {qbt_client.app.version}")
print(f"qBittorrent Web API: {qbt_client.app.web_api_version}")
for k, v in qbt_client.app.build_info.items():
   print(f"{k}: {v}")
# retrieve and show all torrents
```

(continues on next page)

(continued from previous page)

```
for torrent in qbt_client.torrents_info():
    print(f"{torrent.hash[-6:]}: {torrent.name} ({torrent.state})")

# stop all torrents
qbt_client.torrents.stop.all()
```

Usage

First, the Web API endpoints are organized in to eight namespaces.

- Authentication (auth)
- Application (app)
- Log (log)
- Sync (sync)
- Transfer (transfer)
- Torrent Management (torrents)
- RSS (rss)
- Search (search)

Second, this client has two modes of interaction with the qBittorrent Web API.

Each Web API endpoint is implemented one-to-one as a method of the instantiated client.

However, a more robust interface to the endpoints is available via each namespace. This is intended to provide a more seamless and intuitive interface to the Web API.

Finally, some of the objects returned by the client support methods of their own. This is most pronounced for torrents themselves.

1.4.2 Behavior & Configuration

Host, Username and Password

• The authentication credentials can be provided when instantiating *Client*:

```
qbt_client = Client(host="localhost:8080", username='...', password='...')
```

• The credentials can also be specified after *Client* is created but calling *auth_log_in()* is not strictly necessary to authenticate the client; this will happen automatically for any API request.

```
qbt_client.auth_log_in(username='...', password='...')
```

- Alternatively, the credentials can be specified in environment variables:
 - QBITTORRENTAPI_HOST
 - QBITTORRENTAPI_USERNAME
 - QBITTORRENTAPI_PASSWORD

qBittorrent Session Management

- Any time a connection is established with qBittorrent, it instantiates a session to manage authentication for all subsequent API requests.
- This client will transparently manage sessions by ensuring the client is always logged in in-line with any API request including requesting a new session upon expiration of an existing session.
- However, each new *Client* instantiation will create a new session in qBittorrent.
- Therefore, if many *Client* instances will be created be sure to call *auth_log_out* for each instance or use a context manager.
- Otherwise, qBittorrent may experience abnormally high memory usage.

```
with qbittorrentapi.Client(**conn_info) as qbt_client:
   if qbt_client.torrents_add(urls="...") != "0k.":
     raise Exception("Failed to add torrent.")
```

Untrusted Web API Certificate

- qBittorrent allows you to configure HTTPS with an untrusted certificate; this commonly includes self-signed certificates.
- When using such a certificate, instantiate Client with VERIFY_WEBUI_CERTIFICATE=False or set environment variable QBITTORRENTAPI_DO_NOT_VERIFY_WEBUI_CERTIFICATE to a non-null value.
- Failure to do this for will cause connections to qBittorrent to fail.

As a word of caution, doing this actually does turn off certificate verification. Therefore, for instance, potential man-in-the-middle attacks will not be detected and reported (since the error is suppressed). However, the connection will remain encrypted.

```
qbt_client = Client(..., VERIFY_WEBUI_CERTIFICATE=False}
```

Requests Configuration

- The Requests package is used to issue HTTP requests to qBittorrent to facilitate this API.
- Much of Requests configuration for making HTTP requests can be controlled with parameters passed along with the request payload.
- For instance, HTTP Basic Authorization credentials can be provided via auth, timeouts via timeout, or Cookies via cookies. See Requests documentation for full details.
- These parameters are exposed here in two ways; the examples below tell Requests to use a connect timeout of 3.1 seconds and a read timeout of 30 seconds.
- When you instantiate *Client*, you can specify the parameters to use in all HTTP requests to qBittorrent:

```
qbt_client = Client(..., REQUESTS_ARGS={'timeout': (3.1, 30)}
```

• Alternatively, parameters can be specified for individual requests:

```
qbt_client.torrents_info(..., requests_args={'timeout': (3.1, 30)})
```

Additionally, configuration for the HTTPAdapter for the Session can be specified via the HTTPADAPTER_ARGS
parameter for Client:

```
qbt_client = Client(..., HTTPADAPTER_ARGS={"pool_connections": 100, "pool_maxsize": 100}
```

Additional HTTP Headers

- For consistency, HTTP Headers can be specified using the method above; for backwards compatibility, the methods below are supported as well.
- Either way, these additional headers will be incorporated (using clobbering) into the rest of the headers to be sent.
- To send a custom HTTP header in all requests made from an instantiated client, declare them during instantiation:

```
qbt_client = Client(..., EXTRA_HEADERS={'X-My-Fav-Header': 'header value')
```

• Alternatively, you can send custom headers in individual requests:

```
qbt_client.torrents.add(..., headers={'X-My-Fav-Header': 'header value')
```

Unimplemented API Endpoints

- Since the qBittorrent Web API has evolved over time, some endpoints may not be available from the qBittorrent host.
- By default, if a request is made to endpoint that doesn't exist for the version of the qBittorrent host (e.g., the Search endpoints were introduced in Web API v2.1.1), there's a debug logger output and None is returned.
- To raise NotImplementedError instead, instantiate Client with:

```
qbt_client = Client(..., RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=True)
```

qBittorrent Version Checking

- It is also possible to either raise an Exception for qBittorrent hosts that are not "fully" supported or manually check for support.
- The most likely situation for this to occur is if the qBittorrent team publishes a new release but its changes have not been incorporated in to this client yet.
- Instantiate Client like below to raise *UnsupportedQbittorrentVersion* exception for versions not fully supported:

```
qbt_client = Client(..., RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=True)
```

• Additionally, *Version* can be used for manual introspection of the versions.

```
Version.is_app_version_supported(qbt_client.app.version)
```

Disable Logging Debug Output

• Instantiate Client with DISABLE_LOGGING_DEBUG_OUTPUT=True or manually disable logging for the relevant packages:

```
logging.getLogger('qbittorrentapi').setLevel(logging.INFO)
logging.getLogger('requests').setLevel(logging.INFO)
logging.getLogger('urllib3').setLevel(logging.INFO)
```

1.4.3 Async Support

qbittorrent-api does not support Python's async/await functionality for asynchronous programming. However, many use-cases for this client operate within an existing asynchronous application. Therefore, in lieu of being able to await this client's API calls to qBittorrent, it is still possible to call them without blocking.

Each asyncio Event Loop provides a ThreadPoolExecutor that can run blocking code that could interfere with async applications. In Python 3.9, a simple interface was introduced in asyncio to run synchronous code in this thread pool.

```
async def fetch_torrents() -> TorrentInfoList:
    return await asyncio.to_thread(qbt_client.torrents_info, category="uploaded")
```

In this example, you simply specify the method to call, torrents_info, as the first argument and follow it with the arguments for the method to run in the thread.

Below is a full example demonstrating this that can be run in the Python REPL:

```
import asyncio
import qbittorrentapi

qbt_client = qbittorrentapi.Client()

async def fetch_qbt_info():
    return await asyncio.to_thread(qbt_client.app_build_info)

print(asyncio.run(fetch_qbt_info()))
```

1.4.4 Performance

By default, complex objects are returned from some endpoints. These objects allow for accessing the response's items as attributes and include methods for contextually relevant actions (such as start() and stop() for a torrent, for example).

This comes at the cost of performance, though. Generally, this cost isn't large; however, some endpoints, such as torrents_files(), may need to convert a large payload and the cost can be significant.

This client can be configured to always return only the simple JSON if desired. Simply set SIMPLE_RESPONSES=True when instantiating the client.

```
qbt_client = qbittorrentapi.Client(
   host='localhost:8080',
   username='admin',
   password='adminadmin',
   SIMPLE_RESPONSES=True,
)
```

Alternatively, SIMPLE_RESPONSES can be set to True to return the simple JSON only for an individual method call.

```
qbt_client.torrents.files(torrent_hash='...', SIMPLE_RESPONSES=True)
```

1.4.5 Exceptions

exception APIError

Bases: Exception

Base error for all exceptions from this Client.

exception UnsupportedQbittorrentVersion

Bases: APIError

Connected qBittorrent is not fully supported by this Client.

exception FileError

Bases: OSError, APIError

Base class for all exceptions for file handling.

exception TorrentFileError

Bases: FileError

Base class for all exceptions for torrent files.

exception TorrentFileNotFoundError

Bases: TorrentFileError

Specified torrent file does not appear to exist.

exception TorrentFilePermissionError

Bases: TorrentFileError

Permission was denied to read the specified torrent file.

exception APIConnectionError(*args, **kwargs)

Bases: RequestException, APIError

Base class for all communications errors including HTTP errors.

```
exception LoginFailed(*args, **kwargs)
     Bases: APIConnectionError
     This can technically be raised with any request since log in may be attempted for any request and could fail.
exception HTTPError(*args, **kwargs)
     Bases: HTTPError, APIConnectionError
     Base error for all HTTP errors.
     All errors following a successful connection to qBittorrent are returned as HTTP statuses.
     http_status_code: int
exception HTTP4XXError(*args, **kwargs)
     Bases: HTTPError
     Base error for all HTTP 4XX statuses.
exception HTTP5XXError(*args, **kwargs)
     Bases: HTTPError
     Base error for all HTTP 5XX statuses.
exception HTTP400Error(*args, **kwargs)
     Bases: HTTP4XXError
     HTTP 400 Status.
     http_status_code: int = 400
exception HTTP401Error(*args, **kwargs)
     Bases: HTTP4XXError
     HTTP 401 Status.
     http_status_code: int = 401
exception HTTP403Error(*args, **kwargs)
     Bases: HTTP4XXError
     HTTP 403 Status.
     http_status_code: int = 403
exception HTTP404Error(*args, **kwargs)
     Bases: HTTP4XXError
     HTTP 404 Status.
     http_status_code: int = 404
exception HTTP405Error(*args, **kwargs)
     Bases: HTTP4XXError
     HTTP 405 Status.
     http_status_code: int = 405
exception HTTP409Error(*args, **kwargs)
     Bases: HTTP4XXError
     HTTP 409 Status.
```

```
http_status_code: int = 409
exception HTTP415Error(*args, **kwargs)
     Bases: HTTP4XXError
     HTTP 415 Status.
     http_status_code: int = 415
exception HTTP500Error(*args, **kwargs)
     Bases: HTTP5XXError
     HTTP 500 Status.
     http_status_code: int = 500
exception MissingRequiredParameters400Error(*args, **kwargs)
     Bases: HTTP400Error
     Endpoint call is missing one or more required parameters.
exception InvalidRequest400Error(*args, **kwargs)
     Bases: HTTP400Error
     One or more endpoint arguments are malformed.
exception Unauthorized401Error(*args, **kwargs)
     Bases: HTTP401Error
     Primarily reserved for XSS and host header issues.
exception Forbidden403Error(*args, **kwargs)
     Bases: HTTP403Error
     Not logged in, IP has been banned, or calling an API method that isn't public.
exception NotFound404Error(*args, **kwargs)
     Bases: HTTP404Error
     This should mean qBittorrent couldn't find a torrent for the torrent hash.
exception MethodNotAllowed405Error(*args, **kwargs)
     Bases: HTTP405Error
     HTTP method is not supported for the API endpoint.
exception Conflict409Error(*args, **kwargs)
     Bases: HTTP409Error
     Returned if arguments don't make sense specific to the endpoint.
exception UnsupportedMediaType415Error(*args, **kwargs)
     Bases: HTTP415Error
     torrents/add endpoint will return this for invalid URL(s) or files.
exception InternalServerError500Error(*args, **kwargs)
     Bases: HTTP500Error
     Returned if qBittorrent errors internally while processing the request.
```

1.4.6 API Reference

```
Application
class AppAPIMixIn(host=None, port=None, username=None, password=None, EXTRA_HEADERS=None,
                    REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None,
                    VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False,
                    RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False,
                    RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False,
                    VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False,
                    DISABLE\_LOGGING\_DEBUG\_OUTPUT=False) \rightarrow None
     Bases: AuthAPIMixIn
     Implementation of all Application API methods.
          Usage
              >>> from qbittorrentapi import Client
              >>> client = Client(host="localhost:8080", username="admin", password=
              →"adminadmin")
              >>> client.app_version()
              >>> client.app_preferences()
     app\_build\_info(**kwargs) \rightarrow BuildInfoDictionary
          qBittorrent build info.
          This method was introduced with qBittorrent v4.2.0 (Web API v2.3).
              Return type
                 BuildInfoDictionary
     app\_cookies(**kwargs) \rightarrow CookieList
          Retrieve current cookies.
              Return type
                 CookieList
     app_default_save_path(**kwargs) \rightarrow str
          The default path where torrents are saved.
              Return type
     app\_get\_directory\_content(directory\_path=None) \rightarrow DirectoryContentList
          The contents of a directory file path.
              Raises
                 NotFound404Error – file path not found or not a directory
              Parameters
```

directory_path (str | PathLike[AnyStr] | None) - file system path to directory

Return type

DirectoryContentList

 $app_network_interface_address_list(interface_name=", **kwargs) \rightarrow NetworkInterfaceAddressList$

The addresses for a network interface; omit name for all addresses.

This method was introduced with qBittorrent v4.2.0 (Web API v2.3).

```
Parameters
             interface_name (str) – Name of interface to retrieve addresses for
         Return type
             NetworkInterfaceAddressList
app_network_interface_list(**kwargs) → NetworkInterfaceList
     The list of network interfaces on the host.
     This method was introduced with qBittorrent v4.2.0 (Web API v2.3).
         Return type
             NetworkInterfaceList
app\_preferences(**kwargs) \rightarrow ApplicationPreferencesDictionary
     Retrieve qBittorrent application preferences.
         Return type
             ApplicationPreferencesDictionary
app\_send\_test\_email() \rightarrow None
     Sends a test email using the configured email address.
         Return type
             None
app\_set\_cookies(cookies=None, **kwargs) \rightarrow None
     Set cookies.
     cookies = \Gamma
          {
               'domain': 'example.com',
               'path': '/example/path',
               'name': 'cookie name',
               'value': 'cookie value',
               'expirationDate': 1729366667,
          },
     ]
         Parameters
             cookies (CookieList | Sequence[Mapping[str, str | int]] | None) - list of cookies to
         Return type
             None
app\_set\_preferences(prefs=None, **kwargs) \rightarrow None
     Set one or more preferences in qBittorrent application.
         Parameters
             prefs (ApplicationPreferencesDictionary | Mapping[str, Any] | None) - dictionary
             of preferences to set
         Return type
             None
app\_shutdown(**kwargs) \rightarrow None
     Shutdown qBittorrent.
```

```
Return type
                 None
     app\_version(**kwargs) \rightarrow str
         qBittorrent application version.
             Return type
                 str
     app_web_api_version(**kwargs) → str
         qBittorrent Web API version.
             Return type
                 str
class Application(*args, client, **kwargs)
     Allows interaction with Application API endpoints.
         Usage
             >>> from qbittorrentapi import Client
             >>> client = Client(host="localhost:8080", username="admin", password=
              → "adminadmin")
             >>> # these are all the same attributes that are available as named in.

→ the

                     endpoints or the more pythonic names in Client (with or without
             >>> #
              →'app_' prepended)
             >>> webapiVersion = client.application.webapiVersion
             >>> web_api_version = client.application.web_api_version
             >>> app_web_api_version = client.application.web_api_version
             >>> # access and set preferences as attributes
             >>> is_dht_enabled = client.application.preferences.dht
             >>> # supports sending a just subset of preferences to update
             >>> client.application.preferences = dict(dht=(not is_dht_enabled))
             >>> prefs = client.application.preferences
             >>> prefs["web_ui_clickjacking_protection_enabled"] = True
             >>> client.app.preferences = prefs
             >>>
             >>> client.application.shutdown()
     property build_info: BuildInfoDictionary
         Implements app_build_info().
     property cookies: CookieList
         Implements app_cookies().
     property default_save_path: str
         Implements app_default_save_path().
     \texttt{get\_directory\_content}(directory\_path=None) \rightarrow DirectoryContentList
         Implements app_get_directory_content().
             Return type
                 DirectoryContentList
     network\_interface\_address\_list(interface\_name=", **kwargs) \rightarrow NetworkInterfaceAddressList
         Implements app_network_interface_address_list().
```

```
Return type
                 NetworkInterfaceAddressList
     property network_interface_list: NetworkInterfaceList
          Implements app_network_interface_list().
     property preferences: ApplicationPreferencesDictionary
          Implements app_preferences().
     send_test_email() \rightarrow None
          Implements app_send_test_email().
              Return type
                 None
     set\_cookies=None, **kwargs) \rightarrow None
          Implements app_set_cookies().
              Return type
                 None
     set_preferences(prefs=None, **kwargs) → None
          Implements app_set_preferences().
              Return type
                 None
     shutdown(**kwargs) \rightarrow None
          Implements app_shutdown().
              Return type
                 None
     property version: str
          Implements app_version().
     property web_api_version: str
          Implements app_web_api_version().
class ApplicationPreferencesDictionary(data=None, **kwargs)
     Bases: Dictionary[None | int | str | bool | Sequence[JsonValueT] | Mapping[str, JsonValueT]]
     Response for app_preferences()
     Definition:

class DirectoryContentList(list_entries, client=None)
     Bases: List[str]
     Response for app_get_directory_content()
```

AttrDict (internal)

Copyright (c) 2013 Brendan Curran-Johnson

```
class AttrDict(*args, **kwargs) \rightarrow None Bases: dict[str, V], MutableAttr[V] A dict that implements MutableAttr.
```

class MutableAttr

Bases: Attr[str, V], MutableMapping[str, V], ABC

Response for app_network_interface_address_list()

A mixin mapping class that allows for attribute-style access of values.

class Attr

Bases: Mapping[K, V], ABC

A mixin class for a mapping that allows for attribute-style access of values.

A key may be used as an attribute if:

- It is a string
- It matches ^[A-Za-z][A-Za-z0-9_]*\$ (i.e., a public attribute)
- The key doesn't overlap with any class attributes (for Attr, those would be get, items, keys, values, mro, and register).

If a value which is accessed as an attribute is a Sequence-type (and is not a string/bytes), it will be converted to a _sequence_type with any mappings within it converted to Attrs.

NOTE:

This means that if _sequence_type is not None, then a sequence accessed as an attribute will be a different object than if accessed as an attribute than if it is accessed as an item.

Authentication

class AuthAPIMixIn(host=None, port=None, username=None, password=None, EXTRA_HEADERS=None, REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False, RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False, RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False, VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False, DISABLE_LOGGING_DEBUG_OUTPUT=False) \rightarrow None

Bases: Request

Implementation of all Authorization API methods.

Usage

 $\textbf{auth_log_in}(\textit{username} = None, \textit{password} = None, **kwargs) \rightarrow \texttt{None}$

Log in to qBittorrent host.

Raises

- LoginFailed if credentials failed to log in
- Forbidden403Error if user is banned...or not logged in

Parameters

- username (str | None) username for qBittorrent client
- password (str | None) password for qBittorrent client

Return type

None

 $auth_log_out(**kwargs) \rightarrow None$

End session with qBittorrent.

Return type

None

property is_logged_in: bool

Returns True if low-overhead API call succeeds; False otherwise.

There isn't a reliable way to know if an existing session is still valid without attempting to use it. qBittorrent invalidates cookies when they expire.

Returns

True/False if current authorization cookie is accepted by qBittorrent

class Authorization(*args, client, **kwargs)

Allows interaction with the Authorization API endpoints.

Usage

```
>>> from qbittorrentapi import Client
        >>> client = Client(host="localhost:8080", username="admin", password=
        → "adminadmin")
        >>> is_logged_in = client.auth.is_logged_in
        >>> client.auth.log_in(username="admin", password="adminadmin")
        >>> client.auth.log_out()
property is_logged_in: bool
    Implements is_logged_in().
\log_{in}(username=None, password=None, **kwargs) \rightarrow None
    Implements auth_log_in().
        Return type
            None
log_out(**kwargs) \rightarrow None
    Implements auth_log_out().
        Return type
            None
```

Client

```
class Client (host=", port=None, username=None, password=None, * (Keyword-only parameters separator (PEP 3102)), EXTRA_HEADERS=None, REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False, RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False, RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False, VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False, DISABLE_LOGGING_DEBUG_OUTPUT=False)
```

Bases: LogAPIMixIn, SyncAPIMixIn, TransferAPIMixIn, TorrentsAPIMixIn, TorrentCreatorAPIMixIn, RSSAPIMixIn, SearchAPIMixIn

Initialize API for qBittorrent client.

Host must be specified. Username and password can be specified at login. A call to *auth_log_in()* is not explicitly required if username and password are provided during Client construction.

Usage

Parameters

- host (str) hostname for qBittorrent Web API, [http[s]://]hostname[:port][/path]
- **port** (str | int | None) port number for qBittorrent Web API (ignored if host contains a port)
- username (str | None) username for qBittorrent Web API
- password (str | None) password for qBittorrent Web API

- SIMPLE_RESPONSES (bool) By default, complex objects are returned from some endpoints. These objects will allow for accessing responses' items as attributes and include methods for contextually relevant actions. This comes at the cost of performance. Generally, this cost isn't large; however, some endpoints, such as torrents_files() method, may need to convert a large payload. Set this to True to return the simple JSON back. Alternatively, set this to True only for an individual method call. For instance, when requesting the files for a torrent: client.torrents_files(torrent_hash='...', SIMPLE_RESPONSES=True)
- **VERIFY_WEBUI_CERTIFICATE** (bool) Set to False to skip verify certificate for HTTPS connections; for instance, if the connection is using a self-signed certificate. Not setting this to False for self-signed certs will cause a *APIConnectionError* exception to be raised.
- **EXTRA_HEADERS** (Mapping[str, str] | None) Dictionary of HTTP Headers to include in all requests made to qBittorrent.
- **REQUESTS_ARGS** (Mapping[str, Any] | None) Dictionary of configuration for each HTTP request made by requests.request.
- HTTPADAPTER_ARGS (Mapping[str, Any] | None) Dictionary of configuration for HTTPAdapter.
- FORCE_SCHEME_FROM_HOST (bool) If a scheme (i.e. http or https) is specified in host, it will be used regardless of whether qBittorrent is configured for HTTP or HTTPS communication. Normally, this client will attempt to determine which scheme qBittorrent is actually listening on... but this can cause problems in rare cases. Defaults False.
- RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS (bool) Some endpoints may not be implemented in older versions of qBittorrent. Setting this to True will raise a NotImplementedError instead of just returning None.
- RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS (bool) Raise UnsupportedQbittorrentVersion if the connected version of qBittorrent is not fully supported by this client. Defaults False.
- **DISABLE_LOGGING_DEBUG_OUTPUT** (bool) Turn off debug output from logging for this package as well as requests & urllib3.

Definitions

APIKwargsT

Type Any for kwargs parameters for API methods.

class APINames(*values)

```
Bases: str, Enum
API namespaces for API endpoints.
e.g torrents in http://localhost:8080/api/v2/torrents/addTrackers
Application = 'app'
Authorization = 'auth'
EMPTY = ''
Log = 'log'
RSS = 'rss'
```

```
Search = 'search'
     Sync = 'sync'
     TorrentCreator = 'torrentcreator'
     Torrents = 'torrents'
     Transfer = 'transfer'
class ClientCache(*args, client, **kwargs)
     Bases: Generic[ClientT]
     Caches the client.
     Subclass this for any object that needs access to the Client.
class ClientT
     Type for this API Client.
     alias of TypeVar('ClientT', bound=Request)
class Dictionary(data=None, **kwargs)
     Bases: AttrDict[V]
     Base definition of dictionary-like objects returned from qBittorrent.
FilesToSendT
     Type for Files input to API method.
     alias of Mapping[str, bytes | tuple[str, bytes]]
JsonValueT
     Type to define JSON.
     alias of None | int | str | bool | Sequence[JsonValueT] | Mapping[str, JsonValueT]
class List(list_entries=None, entry_class=None, **kwargs)
     Bases: UserList[ListEntryT]
     Base definition for list-like objects returned from qBittorrent.
class ListEntry(data=None, **kwargs)
     Bases: Dictionary[None | int | str | bool | Sequence[JsonValueT] | Mapping[str, JsonValueT]]
     Base definition for objects within a list returned from qBittorrent.
class ListEntryT
     Type for entry in List from API.
     alias of TypeVar('ListEntryT', bound=ListEntry)
ListInputT
     Type for List input to API method.
     alias of Iterable[Mapping[str, None | int | str | bool | Sequence[JsonValueT] | Mapping[str, JsonVal-
     ueT]]]
class TorrentState(*values)
     Bases: str, Enum
     Torrent States as defined by qBittorrent.
```

Note: In qBittorrent v5.0.0:

- PAUSED_UPLOAD was renamed to STOPPED_UPLOAD
- PAUSED_DOWNLOAD was renamed to STOPPED_DOWNLOAD

Definitions:

- wiki: https://github.com/qbittorrent/qBittorrent/wiki/WebUI-API-(qBittorrent-4.1) #user-content-get-torrent-list

    pausedDL was renamed to stoppedDL in Web API v2.11.0
PAUSED_UPLOAD = 'pausedUP'
    pausedUP was renamed to stoppedUP in Web API v2.11.0
QUEUED_DOWNLOAD = 'queuedDL'
```

```
QUEUED_UPLOAD = 'queuedUP'
     STALLED_DOWNLOAD = 'stalledDL'
     STALLED_UPLOAD = 'stalledUP'
     STOPPED_DOWNLOAD = 'stoppedDL'
     STOPPED_UPLOAD = 'stoppedUP'
     UNKNOWN = 'unknown'
     UPLOADING = 'uploading'
     property is_checking: bool
          Returns True if the State is categorized as Checking.
     property is_complete: bool
          Returns True if the State is categorized as Complete.
     property is_downloading: bool
          Returns True if the State is categorized as Downloading.
     property is_errored: bool
          Returns True if the State is categorized as Errored.
     property is_paused: bool
          Alias of TorrentState.is_stopped
     property is_stopped: bool
          Returns True if the State is categorized as Stopped.
     property is_uploading: bool
          Returns True if the State is categorized as Uploading.
class TrackerStatus(*values)
     Bases: int, Enum
     Tracker Statuses as defined by qBittorrent.
     Definitions:
```

- wiki: https://github.com/qbittorrent/qBittorrent/wiki/WebUI-API-(qBittorrent-4.1) #user-content-get-torrent-trackers
- code: https://github.com/qbittorrent/qBittorrent/blob/5dcc14153f046209f1067299494a82e5294d883a/src/base/bittorrent/trackerentry.h#L42

Usage

```
>>> from qbittorrentapi import Client, TrackerStatus
>>> client = Client()
>>> # print torrent hashes for torrents that are downloading
>>> for torrent in client.torrents_info():
>>> for tracker in torrent.trackers:
>>> # display status for each tracker
>>> print(f"{torrent.hash[-6:]}: {TrackerStatus(tracker.status).
--display:>13} :{tracker.url}")
```

```
DISABLED = 0
NOT\_CONTACTED = 1
NOT_WORKING = 4
UPDATING = 3
WORKING = 2
property display: str
```

Returns a descriptive display value for status.

Log

```
class LogAPIMixIn(host=None, port=None, username=None, password=None, EXTRA_HEADERS=None,
                 REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None,
                 VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False,
                 RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False,
                 RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False,
                 VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False,
                 DISABLE\_LOGGING\_DEBUG\_OUTPUT=False) \rightarrow None
```

Bases: AppAPIMixIn

Implementation of all Log API methods.

Usage

```
>>> from qbittorrentapi import Client
>>> client = Client(host="localhost:8080", username="admin", password=
→"adminadmin")
>>> client.log_main(info=False)
>>> client.log_peers()
```

 $\log_{main}(normal=None, info=None, warning=None, critical=None, last known id=None, **kwargs) \rightarrow$ LogMainList

Retrieve the qBittorrent log entries. Iterate over returned object.

Parameters

- normal (bool | None) False to exclude normal entries
- info (bool | None) False to exclude info entries
- warning (bool | None) False to exclude warning entries
- critical (bool | None) False to exclude critical entries
- last_known_id (str | int | None) only entries with an ID greater than this value will be returned

Return type

LogMainList

 $log_peers(last_known_id=None, **kwargs) \rightarrow LogPeersList$

Retrieve qBittorrent peer log.

Parameters

last_known_id (str | int | None) - only entries with an ID greater than this value will be returned

```
Return type
```

LogPeersList

```
class Log(client)
```

Allows interaction with Log API endpoints.

Usage

```
>>> from qbittorrentapi import Client
        >>> client = Client(host="localhost:8080", username="admin", password=
         →"adminadmin")
        >>> # this is all the same attributes that are available as named in the
        >>> # endpoints or the more pythonic names in Client (with or without
         →'log_' prepended)
        >>> log_list = client.log.main()
        >>> peers_list = client.log.peers(last_known_id="...")
        >>> # can also filter log down with additional attributes
        >>> log_info = client.log.main.info(last_known_id=1)
        >>> log_warning = client.log.main.warning(last_known_id=1)
class Main(*args, client, **kwargs)
    __call__(normal=True, info=True, warning=True, critical=True, last known id=None, **kwargs) \rightarrow
              LogMainList
        Implements log_main().
            Return type
              LogMainList
    critical(last known id=None, **kwargs) → LogMainList
        Implements log_main() with info=False, normal=False, and warning=False.
            Return type
              LogMainList
    info(last\_known\_id=None, **kwargs) \rightarrow LogMainList
        Implements log_main().
            Return type
              LogMainList
    normal(last\_known\_id=None, **kwargs) \rightarrow LogMainList
        Implements log_main() with info=False.
            Return type
              LogMainList
    warning(last known id=None, **kwargs) \rightarrow LogMainList
        Implements log_main() with info=False and normal=False.
            Return type
              LogMainList
property main: Main
    Implements log_main().
peers(last\_known\_id=None, **kwargs) \rightarrow LogPeersList
    Implements log_peers().
        Return type
            LogPeersList
```

Chapter 1. Introduction

24

class LogPeersList(list_entries, client=None)

Bases: List[LogPeer]

Response for log_peers()

class LogPeer(data=None, **kwargs)

Bases: ListEntry

Item in LogPeersList

class LogMainList(list_entries, client=None)

Bases: List[LogEntry]

Response to log_main()

class LogEntry(data=None, **kwargs)

Bases: ListEntry

Item in LogMainList

Request (internal)

class QbittorrentSession

Bases: Session

Wrapper to augment Requests Session.

Requests doesn't allow Session to default certain configuration globally. This gets around that by setting defaults for each request.

request(method, url, **kwargs) \rightarrow Response

Constructs a Request, prepares it and sends it. Returns Response object.

Parameters

- method (str) method for the new Request object.
- url (str) URL for the new Request object.
- params (optional) Dictionary or bytes to be sent in the query string for the *Request*.
- data (optional) Dictionary, list of tuples, bytes, or file-like object to send in the body of the *Request*.
- **json** (optional) json to send in the body of the *Request*.
- **headers** (optional) Dictionary of HTTP Headers to send with the *Request*.
- **cookies** (optional) Dict or CookieJar object to send with the *Request*.
- **files** (optional) Dictionary of 'filename': file-like-objects for multipart encoding upload.
- auth (optional) Auth tuple or callable to enable Basic/Digest/Custom HTTP Auth.
- **timeout** (*float or tuple*) (optional) How long to wait for the server to send data before giving up, as a float, or a (connect timeout, read timeout) tuple.
- allow_redirects (bool) (optional) Set to True by default.
- **proxies** (optional) Dictionary mapping protocol or protocol and hostname to the URL of the proxy.
- hooks (optional) Dictionary mapping hook name to one event or list of events, event must be callable.

- **stream** (optional) whether to immediately download the response content. Defaults to False.
- **verify** (optional) Either a boolean, in which case it controls whether we verify the server's TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True. When set to False, requests will accept any TLS certificate presented by the server, and will ignore hostname mismatches and/or expired certificates, which will make your application vulnerable to man-in-the-middle (MitM) attacks. Setting verify to False may be useful during local development or testing.
- cert (optional) if String, path to ssl client cert file (.pem). If Tuple, ('cert', 'key') pair.

Return type

Response

class QbittorrentURL(client)

Bases: object

Management for the qBittorrent Web API URL.

build(*api_namespace*, *api_method*, *headers=None*, *requests_kwargs=None*, *base_path='api/v2'*) → str Create a fully qualified URL for the API endpoint.

Parameters

- api_namespace (APINames | str) the namespace for the API endpoint (e.g. torrents)
- api_method (str) the specific method for the API endpoint (e.g. info)
- base_path (str) base path for URL (e.g. api/v2)
- headers (Mapping[str, str] | None) HTTP headers for request
- requests_kwargs (Mapping[str, Any] | None) kwargs for any calls to Requests

Return type

str

Returns

fully qualified URL string for endpoint

build_base_url(*headers*, *requests_kwargs*) → str

Determine the Base URL for the Web API endpoints.

A URL is only actually built here if it's the first time here or the context was re-initialized. Otherwise, the most recently built URL is used.

If the user doesn't provide a scheme for the URL, it will try HTTP first and fall back to HTTPS if that doesn't work. While this is probably backwards, qBittorrent or an intervening proxy can simply redirect to HTTPS and that'll be respected.

Additionally, if users want to augment the path to the API endpoints, any path provided here will be preserved in the returned Base URL and prefixed to all subsequent API calls.

Parameters

- headers (Mapping[str, str]) HTTP headers for request
- requests_kwargs (Mapping[str, Any]) arguments from user for HTTP HEAD request

Return type

str

Returns

base URL as a string for Web API endpoint

 $detect_scheme(base_url, default_scheme, alt_scheme, headers, requests_kwargs) \rightarrow str$ Determine if the URL endpoint is using HTTP or HTTPS.

Parameters

- base_url (ParseResult) urllib ParseResult URL object
- **default_scheme** (str) default scheme to use for URL
- alt_scheme (str) alternative scheme to use for URL if default doesn't work
- headers (Mapping[str, str]) HTTP headers for request
- requests_kwargs (Mapping[str, Any]) kwargs for calls to Requests

Return type

str

Returns

scheme (i.e. HTTP or HTTPS)

```
class Request(host=None, port=None, username=None, password=None, EXTRA_HEADERS=None, REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False, RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False, RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False, VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False, DISABLE_LOGGING_DEBUG_OUTPUT=False) \rightarrow None
```

Bases: object

Facilitates HTTP requests to qBittorrent's Web API.

```
_auth_request(http_method, api_namespace, api_method, _retry_backoff_factor=0.3, requests_args=None, requests_params=None, headers=None, params=None, data=None, files=None, response_class=<class 'requests.models.Response'>, version_introduced='', version_removed='', **kwargs) \rightarrow Any
```

Wraps API call with re-authorization if first attempt is not authorized.

Return type

Any

```
_cast(response, response\_class, **response\_kwargs) <math>\rightarrow Any
```

Returns the API response casted to the requested class.

Parameters

- response (Response) requests Response from API
- response_class (type) class to return response as; if none, response is returned
- response_kwargs (Any) request-specific configuration for response

Return type

Any

Determine data, params, and files for the Requests call.

Parameters

- http_method (str) get or post
- params (Mapping[str, Any] | None) key value pairs to send with GET calls

- data (Mapping[str, Any] | None) key value pairs to send with POST calls
- **files** (Mapping[str, bytes | tuple[str, bytes]] | None) dictionary of files to send with request

Return type

```
tuple[dict[str, Any], dict[str, Any], Mapping[str, bytes | tuple[str, bytes]]]
```

Send GET request.

Parameters

- api_namespace the namespace for the API endpoint (e.g. APINames or torrents)
- api_method the name for the API endpoint (e.g. add)
- **kwargs** (Any) see _request()

Return type

Any

Returns

Requests Response

_get_cast(_name, _method, response_class, requests_args=None, requests_params=None, headers=None, params=None, data=None, files=None, version_introduced=", version_removed=", **kwargs") \rightarrow ResponseT

Send GET request with casted response.

Parameters

- api_namespace the namespace for the API endpoint (e.g. APINames or torrents)
- api_method the name for the API endpoint (e.g. add)
- kwargs (Any) see _request()

Return type

TypeVar(ResponseT)

 $\textbf{static _handle_error_responses}(\textit{data}, \textit{params}, \textit{response}) \rightarrow \textit{None}$

Raise proper exception if qBittorrent returns Error HTTP Status.

Return type

None

_initialize_context() → None

Initialize and reset communications context with qBittorrent.

This is necessary on startup or when the authorization cookie needs to be replaced...perhaps because it expired, qBittorrent was restarted, significant settings changes, etc.

Return type

None

```
_initialize_settings(EXTRA_HEADERS=None, REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False, RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False, RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False, VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False, DISABLE_LOGGING_DEBUG_OUTPUT=False) \rightarrow None
```

Initialize lesser used configuration.

Return type

None

_is_endpoint_supported_for_version(endpoint, $version_introduced$, $version_removed$) \rightarrow bool Prevent using an API methods that doesn't exist in this version of qBittorrent.

Parameters

- **endpoint** (str) name of the removed endpoint, e.g. torrents/ban_peers
- version_introduced (str) the Web API version the endpoint was introduced
- version_removed (str) the Web API version the endpoint was removed

Return type

bool

classmethod _list2string(input_list, delimiter='|') → str | T

Convert entries in a list to a concatenated string.

Parameters

- input_list (TypeVar(T)) list to convert
- **delimiter** (str) delimiter for concatenation

Return type

```
str | TypeVar(T)
```

 $\begin{tabular}{ll} $\tt post(_name, _method, requests_args=None, requests_params=None, headers=None, params=None, \\ $data=None, files=None, response_class=<class'requests.models.Response'>, version_introduced='', \\ $version_removed='', **kwargs) \to Any \end{tabular}$

Send POST request. Parameters

- api_namespace the namespace for the API endpoint (e.g. APINames or torrents)
- api_method the name for the API endpoint (e.g. add)
- kwargs (Any) see _request()

Return type

Any

 $\begin{tabular}{ll} $\tt post_cast(_name, _method, response_class, requests_args=None, requests_params=None, headers=None, \\ $params=None, data=None, files=None, version_introduced='', version_removed='', **kwargs)$ $\to $ResponseT$ \end{tabular}$

Send POST request with casted response.

Parameters

- api_namespace the namespace for the API endpoint (e.g. APINames or torrents)
- api_method the name for the API endpoint (e.g. add)

• kwargs (Any) – see _request()

Return type

TypeVar(ResponseT)

_request(http_method, api_namespace, api_method, requests_args=None, requests_params=None, headers=None, params=None, data=None, files=None, response_class=<class 'requests.models.Response'>, **kwargs) \rightarrow Any

Meat and potatoes of sending requests to qBittorrent.

Parameters

- http_method (str) get or post
- api_namespace (APINames | str) the namespace for the API endpoint (e.g. APINames or torrents)
- api_method (str) the name for the API endpoint (e.g. add)
- requests_args (Mapping[str, Any] | None) default location for Requests kwargs
- requests_params (Mapping[str, Any] | None) alternative location for Requests kwargs
- headers (Mapping[str, str] | None) HTTP headers to send with the request
- params (Mapping[str, Any] | None) key/value pairs to send with a GET request
- data (Mapping[str, Any] | None) key/value pairs to send with a POST request
- **files** (Mapping[str, bytes | tuple[str, bytes]] | None) files to be sent with the request
- response_class (type) class to use to cast the API response
- kwargs (Any) arbitrary keyword arguments to send with the request

Return type

Any

Wrapper to manage request retries and severe exceptions.

This should retry at least once to account for the Web API switching from HTTP to HTTPS. During the second attempt, the URL is rebuilt using HTTP or HTTPS as appropriate.

Return type

Any

property _session: QbittorrentSession

Create or return existing HTTP session.

$_$ trigger $_$ session $_$ initialization $() \rightarrow N$ one

Effectively resets the HTTP session by removing the reference to it.

During the next request, a new session will be created.

Return type

None

```
_verbose_logging(url, data, params, requests_kwargs, response) → None
Log verbose information about request; can be useful during development.

Return type

None
```

RSS

```
class RSSAPIMixIn(host=None, port=None, username=None, password=None, EXTRA_HEADERS=None, REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False, RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False, RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False, VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False, DISABLE_LOGGING_DEBUG_OUTPUT=False) \rightarrow None
```

Bases: AppAPIMixIn

Implementation of all RSS API methods.

Usage

 $rss_add_feed(url=None, item_path=", **kwargs") \rightarrow None$

Add new RSS feed. Folders in path must already exist.

Raises

Conflict409Error -

Parameters

- url (str | None) URL of RSS feed (e.g. https://distrowatch.com/news/torrents.xml)
- item_path (str) Name and/or path for new feed; defaults to the URL. (e.g. Folder\ Subfolder\FeedName)

Return type

None

```
rss\_add\_folder(folder\_path=None, **kwargs) \rightarrow None
```

Add an RSS folder. Any intermediate folders in path must already exist.

Raises

```
Conflict409Error -
```

Parameters

```
folder_path (str | None) – path to new folder (e.g. Linux\ISOs)
```

Return type

None

 $\textbf{rss_items}(include_feed_data = None, **kwargs) \rightarrow RSSitemsDictionary$

Retrieve RSS items and optionally feed data.

Parameters

include_feed_data (bool | None) - True or false to include feed data

Return type

RSSitemsDictionary

rss_mark_as_read(item_path=None, article_id=None, **kwargs) → None

Mark RSS article as read. If article ID is not provider, the entire feed is marked as read.

This method was introduced with qBittorrent v4.2.5 (Web API v2.5.1).

Raises

NotFound404Error -

Parameters

- item_path (str | None) path to item to be refreshed (e.g. Folder\Subfolder\ ItemName)
- article_id (str | int | None) article ID from rss_items()

Return type

None

 $rss_matching_articles(rule_name=None, **kwargs) \rightarrow RSSitemsDictionary$

Fetch all articles matching a rule.

This method was introduced with qBittorrent v4.2.5 (Web API v2.5.1).

Parameters

rule_name (str | None) - Name of rule to return matching articles

Return type

RSSitemsDictionary

rss_move_item(orig_item_path=None, new_item_path=None, **kwargs) → None

Move/rename an RSS item (folder, feed, etc.).

Raises

Conflict409Error -

Parameters

- orig_item_path (str | None) path to item to be removed (e.g. Folder\Subfolder\ ItemName)
- new_item_path (str | None) path to item to be removed (e.g. Folder\Subfolder\ ItemName)

Return type

None

 $rss_refresh_item(item_path=None, **kwargs) \rightarrow None$

Trigger a refresh for an RSS item.

Note: qBittorrent v4.1.5 through v4.1.8 all use Web API v2.2 but this endpoint was introduced with v4.1.8; so, behavior may be undefined for these versions.

Parameters

item_path (str | None) - path to item to be refreshed (e.g. Folder\Subfolder\
ItemName)

Return type

None

```
rss\_remove\_item(item\_path=None, **kwargs) \rightarrow None
     Remove an RSS item (folder, feed, etc.).
     NOTE: Removing a folder also removes everything in it.
         Raises
             Conflict409Error -
         Parameters
             item_path (str|None) - path to item to be removed (e.g. Folder\Subfolder\ItemName)
         Return type
             None
rss\_remove\_rule(rule\_name=None, **kwargs) \rightarrow None
     Delete a RSS auto-downloading rule.
         Parameters
             rule_name (str | None) - Name of rule to delete
         Return type
             None
rss_rename_rule(orig_rule_name=None, new_rule_name=None, **kwargs) → None
     Rename an RSS auto-download rule.
     This method did not work properly until qBittorrent v4.3.0 (Web API v2.6).
         Parameters
             • orig_rule_name (str | None) - current name of rule
             • new_rule_name (str | None) - new name for rule
         Return type
             None
rss\_rules(**kwargs) \rightarrow RSSRulesDictionary
     Retrieve RSS auto-download rule definitions.
         Return type
             RSSRulesDictionary
rss\_set\_feed\_url(url=None, item\_path=None, **kwargs) \rightarrow None
     Update the URL for an existing RSS feed.
     This method was introduced with qBittorrent v4.6.0 (Web API v2.9.1).
         Raises
             Conflict409Error -
         Parameters
             • url (str | None) – URL of RSS feed (e.g. https://distrowatch.com/news/torrents.xml)
             • item_path (str | None) - Name and/or path for feed (e.g. Folder\Subfolder\
               FeedName)
         Return type
             None
rss_set_rule(rule_name=None, rule_def=None, **kwargs) → None
     Create a new RSS auto-downloading rule.
         Parameters
```

- rule_name (str | None) name for new rule
- rule_def (Mapping[str, qbittorrentapi.definitions.JsonValueT]|None) dictionary with rule fields https://github.com/qbittorrent/qBittorrent/wiki/WebUI-API-(qBittorrent-4.1) #user-content-set-auto-downloading-rule

Return type

None

class RSS(client)

Allows interaction with RSS API endpoints.

Usage

```
>>> from qbittorrentapi import Client
        >>> client = Client(host="localhost:8080", username="admin", password=
        → "adminadmin")
        >>> # this is all the same attributes that are available as named in the
        >>> # endpoints or the more pythonic names in Client (with or without
        →'log_' prepended)
        >>> rss rules = client.rss.rules
        >>> client.rss.addFolder(folder_path="TPB")
        >>> client.rss.addFeed(url="...", item_path="TPB\Top100")
        >>> client.rss.remove_item(item_path="TPB") # deletes TPB and Top100
        >>> client.rss.set_rule(rule_name="...", rule_def={...})
        >>> items = client.rss.items.with_data
        >>> items_no_data = client.rss.items.without_data
class Items(*args, client, **kwargs)
    __call__(include_feed_data=None, **kwargs) \rightarrow RSSitemsDictionary
        Implements rss_items().
            Return type
              RSSitemsDictionary
    property with_data: RSSitemsDictionary
        Implements rss_items() with include_feed_data=True.
    property without_data: RSSitemsDictionary
        Implements rss_items() with include_feed_data=False.
add_feed(url=None, item_path=", **kwargs") \rightarrow None
    Implements rss_add_feed().
        Return type
           None
add_folder(folder\_path=None, **kwargs) \rightarrow None
    Implements rss_add_folder().
        Return type
           None
property items: Items
    Implements rss_items().
mark_as_read(item_path=None, article_id=None, **kwargs) \rightarrow None
    Implements rss_mark_as_read().
```

```
Return type
                  None
     matching\_articles(rule\_name=None, **kwargs) \rightarrow RSSitemsDictionary
          Implements rss_matching_articles().
              Return type
                  RSSitemsDictionary
     move_item(orig item path=None, new item path=None, **kwargs) → None
          Implements rss_move_item().
              Return type
                  None
     refresh_item(item_path=None) → None
          Implements rss_refresh_item().
              Return type
                  None
     remove\_item(item\_path=None, **kwargs) \rightarrow None
          Implements rss_remove_item().
              Return type
                  None
     remove\_rule(rule\_name=None, **kwargs) \rightarrow None
          Implements rss_remove_rule().
              Return type
                  None
     rename_rule(orig_rule_name=None, new_rule_name=None, **kwargs) → None
          Implements rss_rename_rule().
              Return type
                  None
     property rules: RSSRulesDictionary
          Implements rss_rules().
     set_feed_url(url=None, item_path=None, **kwargs) \rightarrow None
          Implements rss_set_feed_url().
              Return type
                  None
     set\_rule(rule\_name=None, rule\_def=None, **kwargs) \rightarrow None
          Implements rss_set_rule().
              Return type
                  None
class RSSitemsDictionary(data=None, **kwargs)
     Bases: Dictionary[None | int | str | bool | Sequence[JsonValueT] | Mapping[str, JsonValueT]]
     Response for rss_items()
```

```
class RSSRulesDictionary(data=None, **kwargs)
```

```
Bases: Dictionary[None | int | str | bool | Sequence[JsonValueT] | Mapping[str, JsonValueT]]
Response for rss_rules()
```

Search

class SearchAPIMixIn(host=None, port=None, username=None, password=None, EXTRA_HEADERS=None, REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False, RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False, RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False, VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False, DISABLE_LOGGING_DEBUG_OUTPUT=False) \rightarrow None

Bases: AppAPIMixIn

Implementation for all Search API methods.

Usage

 $search_categories(plugin_name=None, **kwargs) \rightarrow SearchCategoriesList$

Retrieve categories for search.

This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1) and removed with qBittorrent v4.3.0 (Web API v2.6).

Parameters

 ${\tt plugin_name}\ ({\tt str} \mid {\tt None}) - {\tt Limit}\ categories\ returned\ by\ plugin(s)\ (supports\ all\ and\ enabled)$

Return type

SearchCategoriesList

```
search\_delete(search\_id=None, **kwargs) \rightarrow None
```

Delete a search job.

This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).

Raises

NotFound404Error -

Parameters

search_id (str | int | None) – ID of search to delete

Return type

None

$search_download_torrent(url=None, plugin=None, **kwargs) \rightarrow None$

Download a .torrent file or magnet for a search plugin.

This method was introduced with qBittorrent v5.0.0 (Web API v2.11).

Parameters

- url (str | None) URL for .torrent file or magnet
- plugin (str | None) Name of the plugin

Return type

None

 $search_enable_plugin(plugins=None, enable=None, **kwargs) \rightarrow None$

Enable or disable search plugin(s).

This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).

Parameters

- plugins (str | Iterable[str] | None) list of plugin names
- enable (bool | None) Defaults to True if None or unset; use False to disable

Return type

None

 $search_install_plugin(sources=None, **kwargs) \rightarrow None$

Install search plugins from either URL or file.

This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).

Parameters

```
sources (str | Iterable[str] | None) – list of URLs or filepaths
```

Return type

None

 $search_plugins(**kwargs) \rightarrow SearchPluginsList$

Retrieve details of search plugins.

This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).

Return type

SearchPluginsList

 $search_results(search_id=None, limit=None, offset=None, **kwargs) \rightarrow SearchResultsDictionary$

Retrieve the results for the search.

This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).

Raises

- NotFound404Error -
- Conflict409Error -

Parameters

- search_id (str | int | None) ID of search job
- limit (str | int | None) number of results to return
- offset (str | int | None) where to start returning results

Return type

SearchResultsDictionary

```
search\_start(pattern=None, plugins=None, category=None, **kwargs) \rightarrow SearchJobDictionary
     Start a search. Python must be installed. Host may limit number of concurrent searches.
     This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).
         Raises
              Conflict409Error -
         Parameters
              • pattern (str | None) – term to search for
              • plugins (str | Iterable[str] | None) – list of plugins to use for searching (supports 'all'
                and 'enabled')
              • category (str | None) – categories to limit search; dependent on plugins. (supports 'all')
         Return type
              SearchJobDictionary
search\_status(search\_id=None, **kwargs) \rightarrow SearchStatusesList
     Retrieve status of one or all searches.
     This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).
         Raises
             NotFound404Error -
         Parameters
             search_id (str | int | None) - ID of search to get status; leave empty for status of all jobs
         Return type
              SearchStatusesList
search\_stop(search\_id=None, **kwargs) \rightarrow None
     Stop a running search.
     This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).
         Raises
             NotFound404Error -
         Parameters
              search_id (str | int | None) – ID of search job to stop
         Return type
             None
search\_uninstall\_plugin(names=None, **kwargs) \rightarrow None
     Uninstall search plugins.
     This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).
             names (str | Iterable[str] | None) - names of plugins to uninstall
         Return type
search_update_plugins(**kwargs) → None
     Auto update search plugins.
     This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).
```

```
Return type
```

None

```
class Search(*args, client, **kwargs)
```

Allows interaction with Search API endpoints.

Usage

```
>>> from qbittorrentapi import Client
        >>> client = Client(host="localhost:8080", username="admin", password=
        →"adminadmin")
        >>> # this is all the same attributes that are available as named in the
        >>> # endpoints or the more pythonic names in Client (with or without
        →'search_' prepended)
        >>> # initiate searches and retrieve results
        >>> search_job = client.search.start(pattern="Ubuntu", plugins="all", __

    category="all")

        >>> status = search_job.status()
        >>> results = search_job.result()
        >>> search_job.delete()
        >>> # inspect and manage plugins
        >>> plugins = client.search.plugins
        >>> cats = client.search.categories(plugin_name="...")
        >>> client.search.install_plugin(sources="...")
        >>> client.search.update_plugins()
categories(plugin\_name=None, **kwargs) \rightarrow SearchCategoriesList
    Implements search_categories().
        Return type
            SearchCategoriesList
delete(search\_id=None, **kwargs) \rightarrow None
    Implements search_delete().
        Return type
            None
download\_torrent(url=None, plugin=None, **kwargs) \rightarrow None
    Implements search_download_torrent().
        Return type
            None
enable_plugin(plugins=None, enable=None, **kwargs) \rightarrow None
    Implements search_enable_plugin().
```

Return type

None

install_plugin(*sources=None*, **kwargs) → None

Implements search_install_plugin().

Return type

None

property plugins: SearchPluginsList

Implements search_plugins().

```
results(search\_id=None, limit=None, offset=None, **kwargs) \rightarrow SearchResultsDictionary
          Implements search_results().
              Return type
                   SearchResultsDictionary
     start(pattern=None, plugins=None, category=None, **kwargs) \rightarrow SearchJobDictionary
          Implements search_start().

```

1.4. Usage 41

Implementation of all Sync API Methods.

Usage

 $sync_maindata(rid=0, **kwargs) \rightarrow SyncMainDataDictionary$

Retrieves sync data.

Parameters

rid (str | int) - response ID

Return type

SyncMainDataDictionary

 $sync_torrent_peers(torrent_hash=None, rid=0, **kwargs) \rightarrow SyncTorrentPeersDictionary$

Retrieves torrent sync data.

Raises

NotFound404Error -

Parameters

- torrent_hash (str | None) hash for torrent
- rid (str | int) response ID

Return type

SyncTorrentPeersDictionary

class $Sync(client) \rightarrow None$

Allows interaction with the Sync API endpoints.

Usage:

```
class MainData(client) \rightarrow None
```

```
\_call\_(rid=0, **kwargs) \rightarrow SyncMainDataDictionary
```

Call self as a function.

Return type

SyncMainDataDictionary

```
delta(**kwargs) → SyncMainDataDictionary
              Implements sync_maindata() to return updates since last call.
                  Return type
                     SyncMainDataDictionary
          reset\_rid() \rightarrow None
              Resets RID so the next request includes everything.
                  Return type
                    None
     class TorrentPeers(client) \rightarrow None
          __call__(torrent_hash=None, rid=0, **kwargs) \rightarrow SyncTorrentPeersDictionary
              Implements sync_torrent_peers().
                  Return type
                     SyncTorrentPeersDictionary
          delta(torrent_hash=None, **kwargs) → SyncTorrentPeersDictionary
              Implements sync_torrent_peers() to return updates since last call.
                  Return type
                     SyncTorrentPeersDictionary
          reset\_rid() \rightarrow None
              Resets RID so the next request includes everything.
                  Return type
                    None
     property maindata: MainData
          Implements sync_maindata().
     property torrentPeers: TorrentPeers
          Implements sync_torrent_peers().
     property torrent_peers: TorrentPeers
          Implements sync_torrent_peers().
class SyncMainDataDictionary(data=None, **kwargs)

Torrent Creator

class TorrentCreatorAPIMixIn(host=None, port=None, username=None, password=None,

 $EXTRA_HEADERS=None, REQUESTS_ARGS=None,$ $HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True,$ $FORCE_SCHEME_FROM_HOST=False,$ $RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False,$ $RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False,$ $VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False,$ $DISABLE_LOGGING_DEBUG_OUTPUT=False) \rightarrow None$

Bases: AppAPIMixIn

Implementation of all TorrentCreator API methods.

Usage

 $\label{torrentcreator_add_task} \begin{tabular}{ll} torrent_file_path=None, format=None, \\ start_seeding=None, is_private=None, optimize_alignment=None, \\ padded_file_size_limit=None, piece_size=None, comment=None, \\ trackers=None, url_seeds=None, **kwargs) \to TorrentCreatorTaskDictionary \\ \end{tabular}$

Add a task to create a new torrent.

This method was introduced with qBittorrent v5.0.0 (Web API v2.10.4).

Raises

Conflict409Error – too many existing torrent creator tasks

Parameters

- source_path (str | PathLike[Any] | None) source file path for torrent content
- torrent_file_path (str | PathLike[Any] | None) file path to save torrent
- **format** (Literal['v1', 'v2', 'hybrid'] | None) BitTorrent V1 or V2; defaults to "hybrid" format if None
- **start_seeding** (bool | None) should qBittorrent start seeding this torrent?
- **is_private** (bool | None) is the torrent private or not?
- **optimize_alignment** (bool | None) should optimized alignment be enforced for new torrent?
- padded_file_size_limit (int | None) size limit for padding files
- piece_size (int | None) size of the pieces
- comment (str | None) comment
- trackers (str | list[str] | None) list of trackers to add
- url_seeds (str | list[str] | None) list of URLs seeds to add

Return type

```
TorrentCreatorTaskDictionary
```

```
torrentcreator_delete_task(task_id=None, **kwargs) → None
```

Delete a torrent creation task.

This method was introduced with qBittorrent v5.0.0 (Web API v2.10.4).

Raises

NotFound404Error - task not found

Parameters

task_id (str | None) - ID of torrent creation task

Return type

None

$torrentcreator_status(task_id=None, **kwargs) \rightarrow TorrentCreatorTaskStatusList$

Status for a torrent creation task.

This method was introduced with qBittorrent v5.0.0 (Web API v2.10.4).

Raises

NotFound404Error – task not found

Parameters

task_id (str | None) - ID of torrent creation task

Return type

TorrentCreatorTaskStatusList

torrentcreator_torrent_file(task_id=None, **kwargs) → bytes

Retrieve torrent file for created torrent.

This method was introduced with qBittorrent v5.0.0 (Web API v2.10.4).

Raises

- NotFound404Error task not found
- Conflict409Error torrent creation is not finished or failed

Parameters

```
task_id (str | None) - ID of torrent creation task
```

Return type

bvtes

class TorrentCreator(*args, client, **kwargs)

Allows interaction with TorrentCreator API endpoints.

Usage

```
(continued from previous page)
              >>> task.delete()
              >>> # or
              >>> client.torrentcreator.delete_task(task_id=task.taskID)
     add_task(source_path=None, torrent_file_path=None, format=None, start_seeding=None, is_private=None,
               optimize_alignment=None, padded_file_size_limit=None, piece_size=None, comment=None,
               trackers=None, url\_seeds=None, **kwargs) \rightarrow TorrentCreatorTaskDictionary
          Implements torrentcreator_add_task().
              Return type
                  TorrentCreatorTaskDictionary
     delete\_task(task\_id=None, **kwargs) \rightarrow None
          Implements torrentcreator_delete_task().
              Return type
                  None
     status(task\_id=None, **kwargs) \rightarrow TorrentCreatorTaskStatusList
          Implements torrentcreator_status().
              Return type
                  TorrentCreatorTaskStatusList
     torrent_file(task id=None, **kwargs) \rightarrow bytes
          Implements torrentcreator_torrent_file().
              Return type
                  bytes
class TorrentCreatorTaskDictionary(data, client)
               ClientCache[TorrentCreatorAPIMixIn], Dictionary[None | int | str | bool |
     Sequence[JsonValueT] | Mapping[str, JsonValueT]]
     Response for torrentcreator_add_task()
     delete(**kwargs) \rightarrow None
          Implements torrentcreator_delete_task().
              Return type
                  None
     status(**kwargs) → TorrentCreatorTaskStatus
          Implements torrentcreator_status().
              Return type
                  TorrentCreatorTaskStatus
     torrent_file(**kwargs) \rightarrow bytes
          Implements torrentcreator_torrent_file().
              Return type
                  bytes
class TorrentCreatorTaskStatus(data=None, **kwargs)
     Bases: ListEntry
     Item in TorrentCreatorTaskStatusList
     Definition: not documented...yet
```

```
class TaskStatus(*values)
    Bases: Enum
    Enumeration of possible task statuses.

FAILED = 'Failed'

FINISHED = 'Finished'

QUEUED = 'Queued'

RUNNING = 'Running'

class TorrentCreatorTaskStatusList(list_entries, client=None)
```

Bases: List[TorrentCreatorTaskStatus]

Response for torrentcreator_status()

Torrents

class TorrentsAPIMixIn(host=None, port=None, username=None, password=None,

 $EXTRA_HEADERS=None, REQUESTS_ARGS=None, HTTPADAPTER_ARGS=None, VERIFY_WEBUI_CERTIFICATE=True, FORCE_SCHEME_FROM_HOST=False, RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False, RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False, VERBOSE_RESPONSE_LOGGING=False, SIMPLE_RESPONSES=False, DISABLE_LOGGING_DEBUG_OUTPUT=False) \rightarrow \mathsf{None}$

Bases: AppAPIMixIn

Implementation of all Torrents API methods.

Usage

torrents_add(urls=None, torrent_files=None, save_path=None, cookie=None, category=None, is_skip_checking=None, is_paused=None, is_root_folder=None, rename=None, upload_limit=None, download_limit=None, use_auto_torrent_management=None, is_sequential_download=None, is_first_last_piece_priority=None, tags=None, content_layout=None, ratio_limit=None, seeding_time_limit=None, download_path=None, use_download_path=None, stop_condition=None, add_to_top_of_queue=None, inactive_seeding_time_limit=None, share_limit_action=None, ssl_certificate=None, ssl_private_key=None, ssl_dh_params=None, is_stopped=None, forced=None, **kwargs) \rightarrow str

Add one or more torrents by URLs and/or torrent files.

Returns Ok. for success and Fails. for failure.

Raises

- UnsupportedMediaType415Error if file is not a valid torrent file
- TorrentFileNotFoundError if a torrent file doesn't exist
- TorrentFilePermissionError if read permission is denied to torrent file

Parameters

- urls (str | Iterable[str] | None) single instance or an iterable of URLs (http://, https://, magnet:, bc://bt/)
- torrent_files (TypeVar(TorrentFilesT, bytes, str, IO[bytes], Mapping[str, bytes | str | IO[bytes]], Iterable[bytes | str | IO[bytes]]) | None) several options are available to send torrent files to qBittorrent:
 - single instance of bytes: useful if torrent file already read from disk or downloaded from internet.
 - single instance of file handle to torrent file: use open(<filepath>, 'rb') to open the torrent file.
 - single instance of a filepath to torrent file: e.g. /home/user/torrent_filename.
 - an iterable of the single instances above to send more than one torrent file
 - dictionary with key/value pairs of torrent name and single instance of above object

Note: The torrent name in a dictionary is useful to identify which torrent file errored. qBittorrent provides back that name in the error text. If a torrent name is not provided, then the name of the file will be used. And in the case of bytes (or if filename cannot be determined), the value 'torrent_n' will be used.

- save_path (str | None) location to save the torrent data
- cookie (str | None) cookie(s) to retrieve torrents by URL
- category (str | None) category to assign to torrent(s)
- is_skip_checking (bool | None) True to skip hash checking
- is_paused (bool | None) Adds torrent in stopped state; alias for is_stopped
- **is_root_folder** (bool | None) True or False to create root folder (superseded by content_layout with v4.3.2)
- rename (str | None) new name for torrent(s)
- upload_limit (str | int | None) upload limit in bytes/second
- download_limit (str | int | None) download limit in bytes/second
- use_auto_torrent_management (bool | None) True or False to use automatic torrent management
- is_sequential_download (bool | None) True or False for sequential download
- is_first_last_piece_priority (bool | None) True or False for first and last piece download priority
- tags (str | Iterable[str] | None) tag(s) to assign to torrent(s) (added in Web API v2.6.2)
- content_layout (Literal['Original', 'Subfolder', 'NoSubfolder'] | None) Original, Subfolder, or NoSubfolder to control filesystem structure for content (added in Web API v2.7)
- ratio_limit (str | float | None) share limit as ratio of upload amt over download amt; e.g. 0.5 or 2.0 (added in Web API v2.8.1)
- **seeding_time_limit** (str | int | None) number of minutes to seed torrent (added in Web API v2.8.1)

- download_path (str | None) location to download torrent content before moving to save_path (added in Web API v2.8.4)
- use_download_path (bool | None) True or False whether download_path should be used...defaults to True if download_path is specified (added in Web API v2.8.4)
- stop_condition (Literal['MetadataReceived', 'FilesChecked'] | None) MetadataReceived or FilesChecked to stop the torrent when started automatically (added in Web API v2.8.15)
- add_to_top_of_queue (bool | None) puts torrent at top to the queue(added in Web API v2.8.19)
- inactive_seeding_time_limit (str | int | None) limit for seeding while inactive (added in Web API v2.9.2)
- share_limit_action (Literal['Stop', 'Remove', 'RemoveWithContent', 'EnableSuperSeeding'] | None) override default action when share limit is reached (added in Web API v2.10.4)
- ssl_certificate (str | None) peer certificate (in PEM format) (added in Web API v2.10.4)
- ssl_private_key (str | None) peer private key (added in Web API v2.10.4)
- ssl_dh_params (str | None) Diffie-Hellman parameters (added in Web API v2.10.4)
- **is_stopped** (bool | None) Adds torrent in stopped state; alias for **is_paused** (added in Web API v2.11.0)
- forced (bool | None) add torrent in forced state (added in Web API v2.11.0)

Return type

str

torrents_add_peers(peers=None, $torrent_hashes=None$, **kwargs) $\rightarrow TorrentsAddPeersDictionary$ Add one or more peers to one or more torrents.

This method was introduced with qBittorrent v4.4.0 (Web API v2.3.0).

Raises

InvalidRequest400Error – for invalid peers

Parameters

- **peers** (str | Iterable[str] | None) one or more peers to add. each peer should take the form 'host:port'
- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

TorrentsAddPeersDictionary

 $\textbf{torrents_add_tags}(\textit{tags=None}, \textit{torrent_hashes=None}, **kwargs) \rightarrow \texttt{None}$

Add one or more tags to one or more torrents.

Note: Tags that do not exist will be created on-the-fly.

This method was introduced with qBittorrent v4.2.0 (Web API v2.3.0).

Parameters

• tags (str | Iterable[str] | None) – tag name or list of tags

• torrent_hashes (str | Iterable[str] | None) — single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $torrents_add_trackers(torrent_hash=None, urls=None, **kwargs) \rightarrow None$

Add trackers to a torrent.

Raises

NotFound404Error -

Parameters

- torrent_hash (str | None) hash for torrent
- urls (str | Iterable[str] | None) tracker URLs to add to torrent

Return type

None

 $torrents_add_webseeds(\mathit{torrent_hash}=None, \mathit{urls}=None, **kwargs) \rightarrow None$

Add webseeds to a torrent.

Raises

- NotFound404Error torrent not found
- InvalidRequest400Error invalid URL

Parameters

- torrent_hash (str | None) hash for torrent
- urls (str | Iterable[str] | None) list of webseed URLs to add to torrent

Return type

None

 $torrents_bottom_priority(torrent_hashes=None, **kwargs) \rightarrow None$

Set torrent as lowest priority. Torrent Queuing must be enabled.

Raises

Conflict409Error -

Parameters

torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $torrents_categories(**kwargs) \rightarrow TorrentCategoriesDictionary$

Retrieve all category definitions.

This method was introduced with qBittorrent v4.1.4 (Web API v2.1.1).

Note: torrents/categories is not available until v2.1.0

Return type

TorrentCategoriesDictionary

```
torrents\_count() \rightarrow int
```

Retrieve count of torrents.

Return type

int

 $\label{local_path} \begin{tabular}{ll} torrents_create_category(name=None, save_path=None, download_path=None, enable_download_path=None, **kwargs) \rightarrow None \\ \end{tabular}$

Create a new torrent category.

Raises

Conflict409Error – if category name is not valid or unable to create

Parameters

- name (str | None) name for new category
- **save_path** (str | None) location to save torrents for this category (added in Web API 2.1.0)
- download_path (str | None) download location for torrents with this category
- enable_download_path (bool | None) True or False to enable or disable download path

Return type

None

```
torrents_create_tags(tags=None, **kwargs) → None
```

Create one or more tags.

This method was introduced with qBittorrent v4.2.0 (Web API v2.3.0).

Parameters

```
tags (str | Iterable[str] | None) – tag name or list of tags
```

Return type

None

torrents_decrease_priority(torrent_hashes=None, **kwargs) → None

Decrease the priority of a torrent. Torrent Queuing must be enabled.

Raises

```
Conflict409Error -
```

Parameters

torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

torrents_delete(delete_files=False, torrent_hashes=None, **kwargs) → None

Remove a torrent from qBittorrent and optionally delete its files.

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- delete_files (bool | None) True to delete the torrent's files

Return type

None

```
torrents_delete_tags(tags=None, **kwargs) \rightarrow None
```

Delete one or more tags.

This method was introduced with qBittorrent v4.2.0 (Web API v2.3.0).

Parameters

tags (str | Iterable[str] | None) – tag name or list of tags

Return type

None

 $torrents_download_limit(torrent_hashes=None, **kwargs) \rightarrow TorrentLimitsDictionary$

Retrieve the download limit for one or more torrents.

Return type

TorrentLimitsDictionary

 $\label{locategory} \begin{tabular}{ll} \textbf{torrents_edit_category} (name=None, save_path=None, download_path=None, enable_download_path=None, **kwargs) \rightarrow None \\ \end{tabular}$

Edit an existing category.

This method was introduced with qBittorrent v4.1.3 (Web API v2.1.0).

Raises

Conflict409Error – if category name is not valid or unable to create

Parameters

- name (str | None) category to edit
- save_path (str | None) new location to save files for this category
- download_path (str | None) download location for torrents with this category
- enable_download_path (bool | None) True or False to enable or disable download path

Return type

None

 $torrents_edit_tracker(torrent_hash=None, original_url=None, new_url=None, **kwargs) \rightarrow None$ Replace a torrent's tracker with a different one.

This method was introduced with qBittorrent v4.1.4 (Web API v2.2.0).

Raises

- InvalidRequest400Error -
- NotFound404Error –
- Conflict409Error -

Parameters

- torrent_hash (str | None) hash for torrent
- original_url (str | None) URL for existing tracker
- new_url (str | None) new URL to replace

Return type

None

 $torrents_edit_webseed(torrent_hash=None, orig_url=None, new_url=None, **kwargs) \rightarrow None$ Edit a webseed for a torrent.

Raises

- NotFound404Error torrent not found
- Conflict409Error orig_url is not a webseed for the torrent
- InvalidRequest400Error invalid URL

Parameters

- torrent_hash (str | None) hash for torrent
- orig_url (str | None) webseed URL to be replaced
- new_url (str | None) webseed URL to replace with

Return type

None

```
torrents_export(torrent_hash=None, **kwargs) → bytes
```

Export a .torrent file for the torrent.

This method was introduced with qBittorrent v4.5.0 (Web API v2.8.14).

Raises

- NotFound404Error torrent not found
- Conflict409Error unable to export .torrent file

Parameters

```
torrent_hash (str | None) - hash for torrent
```

Return type

bytes

 $torrents_file_priority(torrent_hash=None, file_ids=None, priority=None, **kwargs) \rightarrow None$ Set priority for one or more files.

Raises

- InvalidRequest400Error if priority is invalid or at least one file ID is not an integer
- NotFound404Error -
- Conflict409Error if torrent metadata has not finished downloading or at least one file
 was not found

Parameters

- torrent_hash (str | None) hash for torrent
- **file_ids** (str | int | Iterable[str | int] | None) single file ID or a list.
- **priority** (str | int | None) **priority** for file(s) https://github.com/qbittorrent/qBittorrent/wiki/WebUI-API-(qBittorrent-4.1)#user-content-set-file-priority

Return type

None

```
torrents\_files(torrent\_hash=None, **kwargs) \rightarrow TorrentFilesList
```

Retrieve individual torrent's files.

Raises

NotFound404Error -

Parameters

torrent_hash (str | None) - hash for torrent

Return type

TorrentFilesList

torrents_increase_priority(torrent_hashes=None, **kwargs) → None

Increase the priority of a torrent. Torrent Queuing must be enabled.

Raises

Conflict409Error -

Parameters

torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $\label{torrents_info} \textbf{(}\textit{status_filter=None, category=None, sort=None, reverse=None, limit=None, offset=None, torrent_hashes=None, tag=None, private=None, include_trackers=None, **kwargs') \rightarrow TorrentInfoList$

Retrieves list of info for torrents.

Parameters

- status_filter (Literal['all', 'downloading', 'seeding', 'completed', 'paused', 'stopped', 'active', 'inactive', 'resumed', 'running', 'stalled', 'stalled_uploading', 'stalled_downloading', 'checking', 'moving', 'errored'] | None) Filter list by torrent status:
 - Original options: all, downloading, seeding, completed, paused, active, inactive, resumed, errored
 - Added in Web API v2.4.1: stalled, stalled_uploading, and stalled_downloading
 - Added in Web API v2.8.4: checking
 - Added in Web API v2.8.18: moving
 - Added in Web API v2.11.0: stopped (replaced paused), running (replaced resumed)
- category (str | None) Filter list by category
- sort (str | None) Sort list by any property returned
- reverse (bool | None) Reverse sorting
- limit (str | int | None) Limit length of list
- **offset** (str | int | None) Start of list (if < 0, offset from end of list)
- torrent_hashes (str | Iterable[str] | None) Filter list by hash (separate multiple hashes with a '|') (added in Web API v2.0.1)
- tag (str | None) Filter list by tag (empty string means "untagged"; no "tag" parameter means "any tag"; added in Web API v2.8.3)
- **private** (bool | None) Filter list by private flag use None to ignore; (added in Web API v2.11.1)

• include_trackers (bool | None) – Include trackers in response; default False; (added in Web API v2.11.4)

Return type

TorrentInfoList

torrents_pause(torrent_hashes=None, **kwargs) → None

Stop one or more torrents in qBittorrent.

Parameters

torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $torrents_piece_hashes(torrent_hash=None, **kwargs) \rightarrow TorrentPieceInfoList$

Retrieve individual torrent's pieces' hashes.

Raises

NotFound404Error -

Parameters

torrent_hash (str | None) - hash for torrent

Return type

TorrentPieceInfoList

 $torrents_piece_states(torrent_hash=None, **kwargs) \rightarrow TorrentPieceInfoList$

Retrieve individual torrent's pieces' states.

Raises

NotFound404Error -

Parameters

torrent_hash (str | None) - hash for torrent

Return type

TorrentPieceInfoList

 $torrents_properties(torrent_hash=None, **kwargs) \rightarrow TorrentPropertiesDictionary$

Retrieve individual torrent's properties.

Raises

NotFound404Error -

Parameters

torrent_hash (str | None) – hash for torrent

Return type

TorrentPropertiesDictionary

 $torrents_reannounce(torrent_hashes=None, **kwargs) \rightarrow None$

Reannounce a torrent.

This method was introduced with qBittorrent v4.1.2 (Web API v2.0.2).

Parameters

torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

```
torrents_recheck(torrent_hashes=None, **kwargs) → None
```

Recheck a torrent in qBittorrent.

Parameters

torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

$torrents_remove_categories(categories=None, **kwargs) \rightarrow None$

Delete one or more categories.

Parameters

categories (str | Iterable[str] | None) - categories to delete

Return type

None

 $torrents_remove_tags(tags=None, torrent_hashes=None, **kwargs) \rightarrow None$

Add one or more tags to one or more torrents.

This method was introduced with qBittorrent v4.2.0 (Web API v2.3.0).

Parameters

- tags (str | Iterable[str] | None) tag name or list of tags
- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $torrents_remove_trackers(torrent_hash=None, urls=None, **kwargs) \rightarrow None$

Remove trackers from a torrent.

This method was introduced with qBittorrent v4.1.4 (Web API v2.2.0).

Raises

- NotFound404Error -
- Conflict409Error -

Parameters

- torrent_hash (str | None) hash for torrent
- urls (str | Iterable[str] | None) tracker URLs to removed from torrent

Return type

None

 $\textbf{torrents_remove_webseeds}(\textit{torrent_hash=None}, \textit{urls=None}, **kwargs) \rightarrow \texttt{None}$

Remove webseeds from a torrent.

Raises

- NotFound404Error -
- InvalidRequest400Error invalid URL

Parameters

• torrent_hash (str | None) - hash for torrent

• urls (str | Iterable[str] | None) - list of webseed URLs to add to torrent

Return type

None

torrents_rename($torrent_hash=None, new_torrent_name=None, **kwargs) \rightarrow None Rename a torrent.$

Raises

NotFound404Error -

Parameters

- torrent_hash (str | None) hash for torrent
- new_torrent_name (str | None) new name for torrent

Return type

None

 $\label{local_none} \textbf{torrents_rename_file}(\textit{torrent_hash=None}, \textit{file_id=None}, \textit{new_file_name=None}, \textit{old_path=None}, \\ \textit{new_path=None}, **kwargs) \rightarrow \texttt{None}$

Rename a torrent file.

This method was introduced with qBittorrent v4.2.1 (Web API v2.4.0).

Raises

- MissingRequiredParameters400Error -
- NotFound404Error -
- Conflict409Error -

Parameters

- torrent_hash (str | None) hash for torrent
- **file_id** (str | int | None) id for file (removed in Web API v2.7)
- new_file_name (str | None) new name for file (removed in Web API v2.7)
- old_path (str | None) path of file to rename (added in Web API v2.7)
- **new_path** (str | None) new path of file to rename (added in Web API v2.7)

Return type

None

 $\label{local_torrent_hash} \textbf{torrent_hash=None}, \textit{old_path=None}, \textit{new_path=None}, **kwargs) \rightarrow \textbf{None} \\ \textbf{Rename a torrent folder}.$

This method was introduced with qBittorrent v4.3.2 (Web API v2.7).

Raises

- MissingRequiredParameters400Error -
- NotFound404Error -
- Conflict409Error -

Parameters

- torrent_hash (str | None) hash for torrent
- old_path (str | None) path of file to rename (added in Web API v2.7)

• **new_path** (str | None) – new path of file to rename (added in Web API v2.7)

Return type

None

torrents_resume(torrent_hashes=None, **kwargs) → None

Start one or more torrents in qBittorrent.

Parameters

torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $torrents_set_auto_management(enable=None, torrent_hashes=None, **kwargs) \rightarrow None$

Enable or disable automatic torrent management for one or more torrents.

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- enable (bool | None) Defaults to True if None or unset; use False to disable

Return type

None

 $\textbf{torrents_set_category} (\textit{category} = \textit{None}, \textit{torrent_hashes} = \textit{None}, **kwargs) \rightarrow \textit{None}$

Set a category for one or more torrents.

Raises

Conflict409Error - for bad category

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- category (str | None) category to assign to torrent

Return type

None

 $torrents_set_download_limit(limit=None, torrent_hashes=None, **kwargs) \rightarrow None$

Set the download limit for one or more torrents.

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- limit (str | int | None) bytes/second (-1 sets the limit to infinity)

Return type

None

 $torrents_set_download_path(download_path=None, torrent_hashes=None, **kwargs) \rightarrow None$

Set the Download Path for one or more torrents.

This method was introduced with qBittorrent v4.4.0 (Web API v2.8.4).

Raises

• Forbidden403Error – cannot write to directory

• Conflict409Error – cannot create directory

Parameters

- **download_path** (str | None) file path to save torrent contents before torrent finishes downloading
- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $torrents_set_force_start(enable=None, torrent_hashes=None, **kwargs) \rightarrow None$

Force start one or more torrents.

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- enable (bool | None) Defaults to True if None or unset; False is equivalent to torrents_resume().

Return type

None

 $torrents_set_location(location=None, torrent_hashes=None, **kwargs) \rightarrow None$

Set location for torrents' files.

Raises

- *Forbidden403Error* if the user doesn't have permissions to write to the location (only before v4.5.2 write check was removed.)
- Conflict409Error if the directory cannot be created at the location

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- location (str | None) disk location to move torrent's files

Return type

None

 $torrents_set_save_path(save_path=None, torrent_hashes=None, **kwargs) \rightarrow None$

Set the Save Path for one or more torrents.

This method was introduced with qBittorrent v4.4.0 (Web API v2.8.4).

Raises

- Forbidden403Error cannot write to directory
- Conflict409Error cannot create directory

Parameters

- save_path (str | None) file path to save torrent contents
- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $\label{limits} \textbf{torrents_set_share_limits}(ratio_limit=None, seeding_time_limit=None, inactive_seeding_time_limit=None, torrent_hashes=None, **kwargs) \rightarrow \\ \textbf{None}$

Set share limits for one or more torrents.

This method was introduced with qBittorrent v4.1.1 (Web API v2.0.1).

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- ratio_limit (str | int | None) max ratio to seed a torrent. (-2 means use the global value and -1 is no limit)
- **seeding_time_limit** (str | int | None) minutes (-2 means use the global value and -1 is no limit)
- inactive_seeding_time_limit (str | int | None) minutes (-2 means use the global value and -1 is no limit) (added in Web API v2.9.2)

Return type

None

torrents_set_super_seeding(enable=None, $torrent_hashes=None$, **kwargs) \rightarrow None Set one or more torrents as super seeding.

Parameters

- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.
- enable (bool | None) Defaults to True if None or unset; False to disable

Return type

None

torrents_set_tags(tags=None, torrent_hashes=None, **kwargs) → None

Upsert one or more tags to one or more torrents.

Note: Tags that do not exist will be created on-the-fly.

This method was introduced with qBittorrent v5.1.0 (Web API v2.11.4).

Parameters

- tags (str | Iterable[str] | None) tag name or list of tags
- torrent_hashes (str | Iterable[str] | None) single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

None

 $\textbf{torrents_set_upload_limit}(\textit{limit=None}, \textit{torrent_hashes=None}, **kwargs) \rightarrow \texttt{None}$

Set the upload limit for one or more torrents.

Parameters

• torrent_hashes (str | Iterable[str] | None) — single torrent hash or list of torrent hashes. Or all for all torrents.

```
• limit (str | int | None) – bytes/second (-1 sets the limit to infinity)
         Return type
             None
torrents_start(torrent_hashes=None, **kwargs) → None
     Start one or more torrents in qBittorrent.
         Parameters
             torrent_hashes (str|Iterable[str]|None) – single torrent hash or list of torrent hashes.
             Or all for all torrents.
         Return type
             None
torrents\_stop(torrent\_hashes=None, **kwargs) \rightarrow None
     Stop one or more torrents in qBittorrent.
         Parameters
             torrent_hashes (str|Iterable[str]|None) - single torrent hash or list of torrent hashes.
             Or all for all torrents.
         Return type
             None
torrents_tags(**kwargs) → TagList
     Retrieve all tag definitions.
     This method was introduced with qBittorrent v4.2.0 (Web API v2.3.0).
         Return type
              TagList
torrents\_toggle\_first\_last\_piece\_priority(torrent\_hashes=None, **kwargs) \rightarrow None
     Toggle priority of first/last piece downloading.
         Parameters
             torrent_hashes (str|Iterable[str]|None) - single torrent hash or list of torrent hashes.
             Or all for all torrents.
         Return type
             None
torrents\_toggle\_sequential\_download(torrent\_hashes=None, **kwargs) \rightarrow None
     Toggle sequential download for one or more torrents.
         Parameters
             torrent_hashes (str | Iterable[str] | None) - single torrent hash or list of torrent hashes.
             Or all for all torrents.
         Return type
             None
torrents_top_priority(torrent_hashes=None, **kwargs) → None
     Set torrent as highest priority. Torrent Queuing must be enabled.
         Raises
```

torrent_hashes (str | Iterable[str] | None) – single torrent hash or list of torrent hashes.

Conflict409Error -

Or all for all torrents.

Parameters

Return type

None

torrents_trackers(torrent_hash=None, **kwargs) → TrackersList

Retrieve individual torrent's trackers. Tracker status is defined in TrackerStatus.

Raises

NotFound404Error -

Parameters

torrent_hash (str | None) - hash for torrent

Return type

TrackersList

 $torrents_upload_limit(torrent_hashes=None, **kwargs) \rightarrow TorrentLimitsDictionary$

Retrieve the upload limit for one or more torrents.

Parameters

torrent_hashes (str|Iterable[str]|None) - single torrent hash or list of torrent hashes. Or all for all torrents.

Return type

TorrentLimitsDictionary

 $torrents_webseeds(torrent_hash=None, **kwargs) \rightarrow WebSeedsList$

Retrieve individual torrent's web seeds.

Raises

NotFound404Error - torrent not found

Parameters

torrent_hash (str | None) – hash for torrent

Return type

WebSeedsList

class Torrents(client) \rightarrow None

Allows interaction with the Torrents API endpoints.

Usage

```
>>> from qbittorrentapi import Client
>>> client = Client(host="localhost:8080", username="admin", password=
→ "adminadmin")
>>> # these are all the same attributes that are available as named in.
→ the
>>> # endpoints or the more pythonic names in Client (with or without
→'torrents_' prepended)
>>> torrent_list = client.torrents.info()
>>> torrent_list_active = client.torrents.info.active()
>>> torrent_list_active_partial = client.torrents.info.active(limit=100,
→ offset=200)
>>> torrent_list_downloading = client.torrents.info.downloading()
>>> # torrent looping
>>> for torrent in client.torrents.info.completed()
>>> # all torrents endpoints with a 'hashes' parameters support all
→method to apply action to all torrents
>>> client.torrents.stop.all()
```

Chapter 1. Introduction

(continued from previous page) >>> client.torrents.start.all() >>> # or specify the individual hashes >>> client.torrents.downloadLimit(torrent_hashes=["...", "..."]) **add**(urls=None, torrent_files=None, save_path=None, cookie=None, category=None, is_skip_checking=None, is_paused=None, is_root_folder=None, rename=None, upload_limit=None, download_limit=None, use_auto_torrent_management=None, is_sequential_download=None, is_first_last_piece_priority=None, tags=None, content_layout=None, ratio_limit=None, $seeding_time_limit=None, download_path=None, use_download_path=None, stop_condition=None, and all the state of the state$ $add_to_top_of_queue = None, inactive_seeding_time_limit = None, share_limit_action = None, share_lim$ $ssl_certificate = None, ssl_private_key = None, ssl_dh_params = None, is_stopped = None, **kwargs) \rightarrow str$ Implements torrents_add(). **Return type** str **add_trackers**(*torrent hash=None*, *urls=None*, **kwargs) → None Implements torrents_add_trackers(). Return type None **add_webseeds**(*torrent_hash=None*, *urls=None*, **kwargs) → None Implements torrents_add_webseeds(). Return type None $count() \rightarrow int$ Implements torrents_count(). **Return type** int $edit_tracker(torrent\ hash=None,\ original\ url=None,\ new\ url=None,\ **kwargs) \rightarrow None$ Implements torrents_edit_tracker(). **Return type** None $edit_webseed(torrent_hash=None, orig_url=None, new_url=None, **kwargs) \rightarrow None$ Implements torrents_edit_webseed(). Return type None **export**(*torrent_hash=None*, **kwargs) → bytes Implements torrents_export(). Return type bytes

1.4. Usage 63

file_priority($torrent_hash=None$, $file_ids=None$, priority=None, **kwargs) \rightarrow None

Implements torrents_file_priority().

Return type None

```
files(torrent\_hash=None, **kwargs) \rightarrow TorrentFilesList
     Implements torrents_files().
         Return type
             TorrentFilesList
piece_hashes(torrent_hash=None, **kwargs) → TorrentPieceInfoList
     Implements torrents_piece_hashes().
         Return type
             TorrentPieceInfoList
piece_states(torrent_hash=None, **kwargs) → TorrentPieceInfoList
     Implements torrents_piece_states().
         Return type
             TorrentPieceInfoList
\textbf{properties}(\textit{torrent\_hash=None}, **kwargs) \rightarrow \textit{TorrentPropertiesDictionary}
     Implements torrents_properties().
         Return type
             TorrentPropertiesDictionary
remove\_trackers(torrent\_hash=None, urls=None, **kwargs) \rightarrow None
     Implements torrents_remove_trackers().
         Return type
remove_webseeds(torrent\_hash=None, urls=None, **kwargs) \rightarrow None
     Implements torrents_remove_webseeds().
         Return type
             None
rename(torrent_hash=None, new_torrent_name=None, **kwargs) → None
     Implements torrents_rename().
         Return type
             None
rename_file(torrent_hash=None, file_id=None, new_file_name=None, old_path=None, new_path=None,
              **kwargs) \rightarrow None
     Implements torrents_rename_file().
         Return type
             None
rename\_folder(torrent\_hash=None, old\_path=None, new\_path=None, **kwargs) \rightarrow None
     Implements torrents_rename_folder().
         Return type
             None
trackers(torrent_hash=None, **kwargs) → TrackersList
     Implements torrents_trackers().
         Return type
             TrackersList
```

```
webseeds(torrent_hash=None, **kwargs) \rightarrow WebSeedsList
         Implements torrents_webseeds().
             Return type
                 WebSeedsList
class TorrentDictionary(data, client) \rightarrow None
     Bases: ClientCache[TorrentsAPIMixIn], ListEntry
     Item in TorrentInfoList. Allows interaction with individual torrents via the Torrents API endpoints.
         Usage
             >>> from qbittorrentapi import Client
             >>> client = Client(host="localhost:8080", username="admin", password=
             →"adminadmin")
             >>> # these are all the same attributes that are available as named in
             →the
             >>> # endpoints or the more pythonic names in Client (with or without
              →'transfer_' prepended)
             >>> torrent = client.torrents.info()[0]
             >>> torrent_hash = torrent.info.hash
             >>> # Attributes without inputs and a return value are properties
             >>> properties = torrent.properties
             >>> trackers = torrent.trackers
             >>> files = torrent.files
             >>> # Action methods
             >>> torrent.edit_tracker(original_url="...", new_url="...")
             >>> torrent.remove_trackers(urls="http://127.0.0.2/")
             >>> torrent.rename(new_torrent_name="...")
             >>> torrent.start()
             >>> torrent.stop()
             >>> torrent.recheck()
             >>> torrent.torrents_top_priority()
             >>> torrent.setLocation(location="/home/user/torrents/")
             >>> torrent.setCategory(category="video")
     add_tags(tags=None, **kwargs) \rightarrow None
         Implements torrents_add_tags().
             Return type
                None
     add_trackers(urls=None, **kwargs) → None
         Implements torrents_add_trackers().
             Return type
                None
     add\_webseeds(urls, **kwargs) \rightarrow None
         Implements torrents_add_webseeds().
             Return type
                 None
     bottom_priority(**kwargs) → None
         Implements torrents_bottom_priority().
```

```
Return type
            None
decrease_priority(**kwargs) → None
     Implements torrents_decrease_priority().
         Return type
            None
delete(delete\ files=None, **kwargs) \rightarrow None
     Implements torrents_delete().
         Return type
            None
property download_limit: int
     Implements torrents_download_limit().
edit\_tracker(orig\_url=None, new\_url=None, **kwargs) \rightarrow None
     Implements torrents_edit_tracker().
         Return type
            None
edit_webseed(orig\_url=None, new\_url=None, **kwargs) \rightarrow None
     Implements torrents_edit_webseed().
         Return type
            None
export(**kwargs) \rightarrow bytes
     Implements torrents_export().
         Return type
            bytes
file\_priority(file\_ids=None, priority=None, **kwargs) \rightarrow None
     Implements torrents_file_priority().
         Return type
            None
property files: TorrentFilesList
     Implements torrents_files().
increase_priority(**kwargs) → None
     Implements torrents_increase_priority().
         Return type
            None
property info: TorrentDictionary
     Returns data from torrents_info() for the torrent.
pause(**kwargs) \rightarrow None
     Implements torrents_stop().
         Return type
            None
```

```
property piece_hashes: TorrentPieceInfoList
     Implements torrents_piece_hashes().
property piece_states: TorrentPieceInfoList
     Implements torrents_piece_states().
property properties: TorrentPropertiesDictionary
     Implements torrents_properties().
reannounce(**kwargs) \rightarrow None
     Implements torrents_reannounce().
         Return type
             None
recheck(**kwargs) \rightarrow None
     Implements torrents_recheck().
         Return type
             None
remove_tags(tags=None, **kwargs) \rightarrow None
     Implements torrents_remove_tags().
         Return type
             None
remove_trackers(urls=None, **kwargs) → None
     Implements torrents_remove_trackers().
         Return type
             None
remove_webseeds(urls=None, **kwargs) \rightarrow None
     Implements torrents_remove_webseeds().
         Return type
             None
rename(new\ name=None, **kwargs) \rightarrow None
     Implements torrents_rename().
         Return type
             None
\textbf{rename\_file}(\textit{file\_id=None}, \textit{new\_file\_name=None}, \textit{old\_path=None}, \textit{new\_path=None}, **kwargs) \rightarrow \texttt{None}
     Implements torrents_rename_file().
         Return type
             None
rename_folder(old_path=None, new_path=None, **kwargs) → None
     Implements torrents_rename_folder().
         Return type
             None
resume(**kwargs) \rightarrow None
     Implements torrents_start().
```

```
Return type
             None
set\_auto\_management(enable=None, **kwargs) \rightarrow None
     Implements torrents_set_auto_management().
         Return type
             None
set_category(category=None, **kwargs) → None
     Implements torrents_set_category().
         Return type
             None
set\_download\_limit(limit=None, **kwargs) \rightarrow None
     Implements torrents_set_download_limit().
         Return type
             None
set\_download\_path(download\_path=None, **kwargs) \rightarrow None
     Implements torrents_set_download_path().
         Return type
             None
set\_force\_start(enable=None, **kwargs) \rightarrow None
     Implements torrents_set_force_start().
         Return type
             None
set_location(location=None, **kwargs) \rightarrow None
     Implements torrents_set_location().
         Return type
             None
set_save_path(save_path=None, **kwargs) → None
     Implements torrents_set_save_path().
         Return type
             None
set_share_limits(ratio_limit=None, seeding_time_limit=None, inactive_seeding_time_limit=None,
                    **kwargs) \rightarrow None
     Implements torrents_set_share_limits().
         Return type
             None
set\_super\_seeding(enable=None, **kwargs) \rightarrow None
     Implements torrents_set_super_seeding().
         Return type
             None
set\_tags(tags=None, **kwargs) \rightarrow None
     Implements torrents_set_tags().
```

```
Return type
                  None
     set\_upload\_limit(limit=None, **kwargs) \rightarrow None
          Implements torrents_set_upload_limit().
              Return type
                  None
     start(**kwargs) \rightarrow None
          Implements torrents_start().
              Return type
                  None
     property state_enum:
                              TorrentState
          Torrent state enum.
     stop(**kwargs) \rightarrow None
          Implements torrents_stop().
              Return type
                  None
     sync_local() \rightarrow None
          Update local cache of torrent info.
              Return type
                  None
     toggle_first_last_piece_priority(**kwargs) → None
          Implements torrents_toggle_first_last_piece_priority().
              Return type
                  None
     toggle\_sequential\_download(**kwargs) \rightarrow None
          Implements torrents_toggle_sequential_download().
              Return type
                  None
     top\_priority(**kwargs) \rightarrow None
          Implements torrents_top_priority().
              Return type
                  None
     property trackers: TrackersList
          Implements torrents_trackers().
     property upload_limit: int
          Implements torrents_upload_limit().
     property webseeds: WebSeedsList
          Implements torrents_webseeds().
class TorrentCategories(*args, client, **kwargs)
     Bases: ClientCache[TorrentsAPIMixIn]
     Allows interaction with torrent categories within the Torrents API endpoints.
```

1.4. Usage 69

Usage

```
>>> from qbittorrentapi import Client
             >>> client = Client(host="localhost:8080", username="admin", password=
             → "adminadmin")
             >>> # these are all the same attributes that are available as named in.

→ the

             >>> # endpoints or the more pythonic names in Client (with or without
             →'torrents_' prepended)
             >>> categories = client.torrent_categories.categories
             >>> # create or edit categories
             >>> client.torrent_categories.create_category(name="Video", save_path="/
             →home/user/torrents/Video")
             >>> client.torrent_categories.edit_category(name="Video", save_path="/
             →data/torrents/Video")
             >>> # edit or create new by assignment
             >>> client.torrent_categories.categories = dict(name="Video", save_path=
             →"/hone/user/")
             >>> # delete categories
             >>> client.torrent_categories.removeCategories(categories="Video")
             >>> client.torrent_categories.removeCategories(categories=["Audio",
             →"IS0s"])
     property categories: TorrentCategoriesDictionary
         Implements torrents_categories().
     create_category(name=None, save_path=None, download_path=None, enable_download_path=None,
                      **kwargs) \rightarrow None
         Implements torrents_create_category().
             Return type
                None
     edit_category(name=None, save path=None, download path=None, enable download path=None,
                    **kwargs) \rightarrow None
         Implements torrents_edit_category().
             Return type
                None
     remove_categories(categories=None, **kwargs) → None
         Implements torrents_remove_categories().
             Return type
                None
class TorrentTags(*args, client, **kwargs)
     Bases: ClientCache[TorrentsAPIMixIn]
     Allows interaction with torrent tags within the "Torrent" API endpoints.
     Usage:
         >>> from qbittorrentapi import Client
         >>> client = Client(host="localhost:8080", username="admin", password=
```

(continues on next page)

→"adminadmin")

```

Transfer

class TransferAPIMixIn(host=None, port=None, username=None, password=None,

 $EXTRA_HEADERS=None$, $REQUESTS_ARGS=None$, $HTTPADAPTER_ARGS=None$, $VERIFY_WEBUI_CERTIFICATE=True$, $FORCE_SCHEME_FROM_HOST=False$, $RAISE_NOTIMPLEMENTEDERROR_FOR_UNIMPLEMENTED_API_ENDPOINTS=False$, $RAISE_ERROR_FOR_UNSUPPORTED_QBITTORRENT_VERSIONS=False$, $VERBOSE_RESPONSE_LOGGING=False$, $SIMPLE_RESPONSES=False$, $DISABLE_LOGGING_DEBUG_OUTPUT=False$) \rightarrow None

Bases: AppAPIMixIn

Implementation of all Transfer API methods.

Usage

```
>>> from qbittorrentapi import Client
>>> client = Client(host="localhost:8080", username="admin", password=
--"adminadmin")
>>> transfer_info = client.transfer_info()
>>> client.transfer_set_download_limit(limit=1024000)
```

transfer_ban_peers(peers=None, **kwargs) → None

Ban one or more peers.

This method was introduced with qBittorrent v4.2.0 (Web API v2.3.0).

Parameters

 $\label{lem:peers} \textbf{peers} \ (\texttt{str} \mid \texttt{Iterable}[\texttt{str}] \mid \texttt{None}) - \textbf{one} \ \textbf{or} \ \textbf{more} \ \textbf{peers} \ \textbf{to} \ \textbf{ban.} \ \textbf{each} \ \textbf{peer} \ \textbf{should} \ \textbf{take} \ \textbf{the} \ \textbf{form 'host:port'}$

Return type

None

transfer_download_limit(**kwargs) → int

Retrieves download limit; 0 is unlimited.

Return type

int

$transfer_info(**kwargs) \rightarrow TransferInfoDictionary$

Retrieves the global transfer info found in qBittorrent status bar.

Return type

TransferInfoDictionary

$transfer_setSpeedLimitsMode(intended_state=None, **kwargs) \rightarrow None$

Sets whether alternative speed limits are enabled.

Parameters

intended_state (bool | None) – True to enable alt speed and False to disable. Leaving None will toggle the current state.

Return type

None

1.4. Usage 73

transfer_set_download_limit(limit=None, **kwargs) → None

```
Set the global download limit in bytes/second.
               Parameters
                   limit (str | int | None) – download limit in bytes/second (0 or -1 for no limit)
               Return type
                   None
     transfer_set_speed_limits_mode(intended state=None, **kwargs) → None
          Sets whether alternative speed limits are enabled.
               Parameters
                   intended_state (bool | None) – True to enable alt speed and False to disable. Leaving
                   None will toggle the current state.
               Return type
                   None
     transfer_set_upload_limit(limit=None, **kwargs) → None
          Set the global download limit in bytes/second.
               Parameters
                   limit (str | int | None) – upload limit in bytes/second (0 or -1 for no limit)
               Return type
                   None
     transfer\_speed\_limits\_mode(**kwargs) \rightarrow str
          Returns 1 if alternative speed limits are currently enabled, 0 otherwise.
               Return type
                   str
     transfer\_toggle\_speed\_limits\_mode(intended\_state=None, **kwargs) \rightarrow None
          Sets whether alternative speed limits are enabled.
               Parameters
                   intended_state (bool | None) - True to enable alt speed and False to disable. Leaving
                   None will toggle the current state.
               Return type
                   None
     transfer_upload_limit(**kwargs) → int
          Retrieves upload limit; 0 is unlimited.
               Return type
                   int
class Transfer(*args, client, **kwargs)
     Allows interaction with the Transfer API endpoints.
          Usage
               >>> from qbittorrentapi import Client
               >>> client = Client(host="localhost:8080", username="admin", password=
               →"adminadmin")

1.4. Usage 75

Version

class Version

Allows introspection for whether this Client supports different versions of the qBittorrent application and its Web API.

Note that if a version is not listed as "supported" here, many (if not all) methods are likely to function properly since the Web API is largely backwards and forward compatible...albeit with some notable exceptions.

```
classmethod is_api_version_supported(api_version) → bool
```

Returns whether a version of the qBittorrent Web API is fully supported by this API client.

Parameters

```
api_version (str) – version of qBittorrent Web API version such as 2.8.4
```

Return type

bool

Returns

True or False for whether version is supported

classmethod is_app_version_supported($app_version$) \rightarrow bool

Returns whether a version of the qBittorrent application is fully supported by this API client.

Parameters

```
app_version (str) – version of qBittorrent application such as v4.4.0
```

Return type

bool

Returns

True or False for whether version is supported

classmethod latest_supported_api_version() \rightarrow str

Returns the most recent version of qBittorrent Web API that is supported.

Return type

str

classmethod latest_supported_app_version() → str

Returns the most recent version of qBittorrent that is supported.

Return type

str

$\textbf{classmethod supported_api_versions()} \rightarrow set[str]$

Set of all supported qBittorrent Web API versions.

Return type

set[str]

classmethod supported_app_versions() \rightarrow set[str]

Set of all supported qBittorrent application versions.

Return type

set[str]
